**Multidimensional Digital Signal Processing** Dan E. Dudgeon, Russell M. Mersereau, 1984 Multidimensional signals and systems Discrete Fourier analysis of multidimensional signals Design and implementation of two dimensional FIR filters Multidimensional recursive systems Design and implementation of two dimensional IIR filters Processing signals carried by propagation waves Inverse problems Multidimensional Digital Signal Processing IEEE Acoustics, Speech and Signal Processing Society (Piscataway, NJ). **Multidimensional**, 1986 Processing of Multidimensional Signals Alexandre Smirnov, 2013-03-09 In this book signals or images described by functions whose number of arguments varies from one to five are considered. These arguments can be time, spatial dimensions or wavelength in a polychromatic signal. The book discusses the basics of mathematical models of signals, their transformations in technical pre-processing systems and criteria of the systems' quality. The models are used for the solution of practical tasks of system analysis, measurement and optimization and signal restoration. Several examples are given Multidimensional Digital Signal Processing Optical Devices for Information Processing and Electromagnetic Analysis and Measurement, 1996 This is the final report on research carried out under this contract. There has been significant progress in the research areas of multidimensional digital signal processing and modeling iterated function systems and stereo image processing morphological systems for multidimensional signal processing, time frequency wavenumber representations, optical devices for information processing, semiconductor quantum wave devices, electromagnetic measurements in the time and frequency domains and in microwave holography in near and far field measurements. This report lists degrees awarded and publications for the three year contract period. Specific research results are contained in the Annual Reports submitted prior to this final report State Space Methods in Multidimensional Digital Signal Processing, 1991 This report summarizes the results of an extensive research program on the real time implementation of multidimensional M-D digital signal processing algorithms. We began our study on the efficient implementation of M-D digital filters. We mapped the M-D digital filter to a state space model because the state space model supports local data communications. We studied various approaches to implementing the state space model for M-D digital signal processing applications. We found that the best approach involves mapping the state space model onto a generalized linear finite state machine which facilitates the hardware implementation. Using this approach we were able to develop a multiprocessor system architecture which is scalable, which is modular and which has a high efficiency. Based upon these results we developed the architecture for an application specific computing system which we call a Block Data Flow.

Architecture BDFA We are currently studying the mapping of several other M D signal processing algorithms and matrix operations to the BDFA These studies show that multiprocessor systems using the BDFA can achieve high throughput and high efficiency at a modest cost **Scalable Parallel Algorithms for Multidimensional Digital Signal Processing**

,1991 A new algorithm for the multiprocessor computation of the multidimensional discrete Fourier transform is presented The algorithm eliminates the need for interprocessor communication and is highly scalable The cost of eliminating interprocessor communication by this method is that one addition must be performed at each processing element for every input loaded into the machine The algorithm is based on a new multidimensional discrete Fourier transform algorithm that computes a d dimensional discrete Fourier transform by a set of independent k dimensional discrete Fourier transforms k

Multidimensional Signal Processing in Automatic Experimentation Michael A. Smith,1989 Digital signal processing of one dimensional data has become a commonplace technique in the chemistry laboratory Two areas where multidimensional digital signal processing is now making great inroads are machine vision and experiment automation In the first part of this thesis a ASCII string comparator IS programmed to compare condensed chain encoded edge outlines of simple geometric shapes and common silhouettes against other objects Adjusting the comparator s internal parameter table allows various features of these objects to be used for feature ranking purposes Thus with the parameter table set for square type features objects with square like features can be extracted from a larger information base of objects In the second part another method of image classification and categorization is investigated Bar code images are transformed into the Fourier spatial frequency domain Once in this domain autocorrelation crosscorrelation and digital filtering can be performed with greater ease than in the spatial domain Bar code targets can be crosscorrelated to master objects by the use of Synthetic Discrimination Filters SDF not only according to the symbol used in the target code but according to the type of symbol alphabetic vs numeric These studies utilized a unique camera system The OpticRAM is a orthogonally mapped DRAM chip with the opaque plastic cover replaced by a clear window This device is light sensitive and when placed in a camera s focal plane it becomes an imaging device By controlling the refresh cycle required for all DRAMs the exposure time can be varied Once the latent image has been taken and the refresh cycle has been restored an image processing computer can utilize this image by accessing memory locations In the third section the automation of an cold fusion experiment is outlined and discussed A cold fusion cell may emit thermal neutrons produce specific energy gamma rays or cause the cell environment to

heat up By utilizing the proper transducers and processing their outputs these phenomena can be recorded by the use of digital computers In addition by using these data the computers can control the experiment shutting the cell down if a temperature excursion occurs Document
