*Optical Communication Theory and Techniques* Enrico Forestieri, 2006-01-26 Since the advent of optical communications a great technological effort has been devoted to the exploitation of the huge bandwidth of optical fibers Starting from a few Mb/s single channel systems a fast and constant technological development has led to the actual 10 Gb/s per channel dense wavelength vision multiplexing DWDM systems with dozens of channels on a single fiber Transmitters and receivers are now ready for 40 Gb/s whereas hundreds of channels can be simultaneously amplified by optical amplifiers Nevertheless despite such a pace in technological progress optical communications are still in a primitive stage if compared for instance to radio communications the widely spread on-off keying OOK modulation format is equivalent to the rough amplitude modulation AM format whereas the DWDM technique is nothing more than the optical version of the frequency vision multiplexing FDM technique Moreover adaptive equalization channel coding or maximum likelihood detection are still considered something exotic in the optical world This is mainly due to the favourable characteristics of the fiber optic channel large bandwidth low attenuation channel stability which so far allowed us to use very simple transmission and detection techniques

*Wireless Optical Communication Systems* Steve Hranilovic, 2006-01-16 This volume addresses the problem of designing efficient signalling and provides a link between the areas of communication theory and modem design for amplitude constrained linear optical intensity channel It provides practical guidelines for the design of signalling sets for wireless optical intensity channels

**Optical Link Component Utilization** Elaine Shin-Yeu Chou, 2021 The exponential growth trend of network traffic during the past few decades continues to be driven by emerging applications As global traffic demands rise the share of traffic carried by optical fiber is increasing simultaneously Therefore it is imperative that future optical fiber links take full advantage of the resources available to maximize capacity This work aims to apply communication theory concepts and signal processing techniques to optical communication links to ultimately increase capacity in systems that are subject to component limitations First we explore the advantages of adaptive rate access networks implemented through adaptive coding and modulation that adjusts the forward error correction code rate and modulation order in response to the channel

conditions of each user Our adaptive coding and modulation scheme can achieve an equalized bit rate of 40 Gb/s with 25G class components on a network with fiber lengths of 5 to 25 km Next we study the fundamental performance of Kramers Kronig detection a technique that uses signal processing to retrieve the phase of a signal from its intensity measurement making comparisons to standard coherent detection and standard direct detection Finally we study the benefit of successive interference cancellation in frequency selective space division multiplexed ultra long haul submarine links with mode dependent gain caused by optical amplifier limitations We show that successive interference cancellation in conjunction with coding across modes decreases capacity loss resulting from mode dependent gain by 39% at 15 000 km and increases system reach by 28% compared to minimum mean square error detection in a link with moderate mode dependent gain

**Handbook of Optical Communications** Josephine Winston, 2019-06-20 Optical communication is the process of using light as a medium of communication The communication can be achieved by employing visual techniques or by using an electronic device An optical communication system comprises of a transmitter a channel and a receiver The transmitter encodes a message into an optical signal which is then carried through a channel and received by a receiver The most commonly used channel for such communication is optical fiber It commonly transmits infrared light through either laser diodes or light emitting diodes This book traces the progress of optical communication technology and highlights some of its key aspects and applications It strives to provide a fair idea about this discipline and to help develop a better understanding of the latest advances within this field Those in search of information to further their knowledge will be greatly assisted by this book

*Enabling Technologies for High Spectral-efficiency Coherent Optical Communication Networks* Xiang Zhou, Chongjin Xie, 2016-04-11 Enabling Technologies for High Spectral efficiency Coherent Optical Communication Networks Presents the technological advancements that enable high spectral efficiency and high capacity fiber optic communication systems and networks This book examines key technology advances in high spectral efficiency fiber optic communication systems and networks enabled by the use of coherent detection and digital signal processing DSP The first of this book's 16 chapters is a detailed introduction Chapter 2 reviews the modulation formats while Chapter 3 focuses on detection and error correction technologies for coherent optical communication systems Chapters 4 and 5 are devoted to Nyquist WDM and orthogonal frequency division multiplexing OFDM In chapter 6 polarization and nonlinear impairments in coherent optical communication systems are discussed The fiber nonlinear effects in a non dispersion managed system are covered in chapter 7 Chapter 8 describes linear impairment equalization and Chapter 9 discusses various nonlinear mitigation techniques Signal synchronization is covered in Chapters 10 and 11 Chapter 12 describes the main constraints put on the DSP algorithms by the hardware structure Chapter 13 addresses the fundamental concepts and recent progress of photonic integration Optical performance monitoring and elastic optical network technology are the subjects of Chapters 14 and 15 Finally Chapter 16 discusses spatial division multiplexing and MIMO processing technology a potential solution to

solve the capacity limit of single mode fibers Contains basic theories and up to date technology advancements in each chapter Describes how capacity approaching coding schemes based on low density parity check LDPC and spatially coupled LDPC codes can be constructed by combining iterative demodulation and decoding Demonstrates that fiber nonlinearities can be accurately described by some analytical models such as GN EGN model Presents impairment equalization and mitigation techniques Enabling Technologies for High Spectral efficiency Coherent Optical Communication Networks is a reference for researchers engineers and graduate students

The field of coherent optics has stimulated much interest and indeed excitement over the past decade and a number of engineering applications have been brought to light. The most significant of these are the subject of this senior or graduate level text which was originally prepared but is not limited to electrical engineering students. It emphasizes the analogy between optical and electrical systems both of which for example are capable of performing Fourier transform operations and signal filtering and processing. The book is designed for students without an intensive background in electromagnetic theory and classical optics. Its discussion of diffraction is based on scalar theory and it approaches information processing and holography by means of the elementary point concept and linear system theory. This approach simplified the analysis so that solutions may be directly calculated and it will appeal to engineering students because of their familiarity with the concepts of the impulse response of linear systems. After an opening presentation of the basic properties of linear systems and Fourier transformations the book develops the theory of diffraction. The topics taken up include among others Fraunhofer and Fresnel diffraction the reciprocity theorem Huygens principle Kirchhoff's integral the Fresnel zone plate the Rayleigh criterion and Abbe's sine condition. This part closes with a discussion of coherent theory and the mutual coherence function. The next part on information processing covers the Fourier transform properties of lenses and linear optical imaging systems filtering the basic properties of photographic film as a recording medium film grain noise and signal to noise ratio the information channel capacity of photographic film and optical resolving power and its relation to the uncertainty of information and physical realizability. The final part throws a clear light on the subject of holography. The presentation includes both linear and nonlinear holograms and takes up wavefront construction and reconstruction magnifications resolution limits and bandwidth requirements finite point analysis linear optimization techniques syntheses of optimum nonlinear spatial filters and applications. Among the latter are microscopic wavefront reconstruction multiexposure holographic interferometry time average interferometry and contour generation.
