This text provides the practising engineer with a review of the current techniques and applications of machine control The  
control of machines is essential in the manufacturing process in order to produce products with more speed efficiency and  
accuracy The range of machinery dependent upon control by a dedicated computer is very broad encompassing sheet metal

exchange of ideas and experience among scientists active in mathematics research relevant to performance and reliability  
aspects of the design of computer and communication systems The spirit of these exchanges and the main issues at stake are  
defined by an unceasing and difficult quest for models and techniques which are in the interests of mathematical tractability

This was reflected in the present program which proposed a balanced and varied mixture of approximation techniques of
