Human greatness has many connotations. Since the requirements for membership in this category are vague and poorly defined, admittance to the Mount Olympus is frequently erratic and subjective, especially in view of a wide penumbra zone of border cases. Nevertheless, rising above a twilight zone of debatable cases, there are individuals whose right for membership is unquestionable. In science, one of the unequivocal criteria for greatness relates to how far one's scientific achievement affects the opening of new horizons and points to directions for future development and progress. Unveiling new visions can derive only from creative people who conceive original ideas and concepts and who are daring enough to promote them against the indifference or opposition of the establishment. Maintaining the integrity and the faith to one's own ideals may require extraordinary strength of character, up to courting persecution or even death, as happened in the middle ages and more recently in the first half of this century with regard to Cecile and Oskar Vogt, whose lives and accomplishments are described in this book. Thus, the greatness of the Vogts is based both on their penetrating vision of the future for brain research and on the sterling quality of their character, which sustained a test of fire during the Nazi years in Germany.

Local interstitial radiation therapy of intrinsic and inaccessible brain tumors is confronted with two major problems: 1. The tolerance of normal brain tissue, which is usually involved in local tumor irradiation, i.e. perifocal white matter edema and demyelinating effects, is crucial. 2. Data on radiation effects of implanted radioactive sources on neoplastic tissue, i.e. data on the radiosensitivity and on the biology of tumors, are still widely unavailable. In clinical practice, the dose with which to achieve a given volume of tumor necrosis is roughly estimated. This report deals with the experimental findings of Iodine 125 and Iridium 192 permanent implants in healthy and neoplastic brain tissue. Our own experimental findings are correlated with experimental data on Yttrium 90 irradiation from the literature. The study is directed to collect data on the tolerance of non-tumoral brain tissue and to attempt to establish a dose-response relationship.

Morphologic Changes in the Dog Brain Following Interstitial Iodine 125 Irradiation. Iodine 125 seeds manufactured by 3M Company, St. Paul, MN, with an activity of 3.55 mCi, were permanently implanted under stereotactic conditions into the subcortical white matter of the gyrus coronalis of the left hemisphere in 6 beagle dogs. One animal with a non-radioactive seed implanted under similar operative conditions served as a control. The animals were allowed to survive 25, 46, 71, 94, 248, 368 days, respectively, after the implantation. The control animal survived 46 days. A detailed description of the experimental procedure is given elsewhere. 16-17
