The basic of the BPM technique in the frequency domain relies on treating the slowly varying envelope of the monochromatic electromagnetic field under paraxial propagation thus allowing efficient numerical computation in terms of speed and allocated memory In addition the BPM based on finite differences is an easy way to implement robust and efficient computer codes This book presents several approaches for treating the light wide angle scalar approach semivectorial treatment and full vectorial treatment of the electromagnetic fields Also special topics in BPM cover the simulation of light propagation in anisotropic media non linear materials electro optic materials and media with gain losses and describe how BPM can deal with strong index discontinuities or waveguide gratings by introducing the bidirectional BPM BPM in the time domain is also described and the book includes the powerful technique of finite difference time domain method which fills the gap when the standard BPM is no longer applicable Once the description of these numerical techniques have been detailed the last chapter includes examples of passive active and functional integrated photonic devices such as waveguide reflectors demultiplexers polarization converters electro optic modulators lasers or frequency converters The book will help readers to understand several BPM approaches to build their own codes or to properly use the existing commercial software based on these numerical techniques **Ion Beam Modification of Materials** J.S.

Williams,R.G. Elliman,M.C. Ridgway,2012-12-02 This conference consisted of 15 oral sessions including three plenary papers covering areas of general interest 22 specialist invited papers and 51 contributed presentations as well as three poster sessions There were several scientific highlights covering a diverse spectrum of materials and ion beam processing methods These included a wide range of conventional and novel applications such as optical displays and opto electronics motor vehicle and tooling parts coatings tailored for desired properties studies of fundamental defect properties the production of novel often buried compounds and treating biomedical materials The study of nanocrystals produced by ion implantation in a

range of host matrices particularly for opto electronics applications was one especially new and exciting development Despite several decades of study major progress was reported at the conference in understanding defect evolution in semiconductors and the role of defects in transient impurity diffusion The use of implantation to tune or isolate optical devices and in forming optically active centres and waveguides in semiconductors polymers and oxide ceramics was a major focus of several presentations at the conference The formation of hard coatings by ion assisted deposition or direct implantation was also an area which showed much recent progress Ion beam techniques had also developed apace particularly those based on plasma immersion ion implantation or alternative techniques for large area surface treatment Finally the use of ion beams for the direct treatment of cancerous tissue was a particularly novel and interesting application of ion beams
