This dissertation deals with optimal control of mathematical models described by partial differential equations and variational inequalities. It consists of two parts. In the first part, optimal control of a two-dimensional steady-state thermistor problem is considered. The thermistor problem is described by a system of two nonlinear elliptic partial differential equations coupled with some boundary conditions. The boundary conditions show how the thermistor is connected to its surroundings. Based on physical considerations, an objective functional to be minimized is introduced, and the convective boundary coefficient is taken to be a control. Existence and uniqueness of the optimal control are proven. To characterize this optimal control, the optimality system consisting of the state and adjoint equations is derived. In the second part, we consider a variational inequality of the obstacle type where the underlying partial differential operator is biharmonic. This kind of variational inequality arises in plasticity theory. It concerns the small transverse displacement of a plate when its boundary is fixed and the whole plate is subject to a pressure to lie on one side of an obstacle. We consider an optimal control problem where the state of the system is given by the solution of the variational inequality and the obstacle is taken to be a control. For a given target profile, we want to find an obstacle such that the corresponding solution to the variational inequality is close to the target profile while the norm of the obstacle does not get too large in the appropriate space. We prove existence of an optimal control and derive the optimality system by using approximation techniques. Namely, the variational inequality and the objective functional are approximated by a semilinear partial differential equation and a corresponding approximating functional, respectively. Approximating Optimal Control Problems Governed by Variational Inequalities Viorel Barbu, Pekka Neittaanmäki, Antti Niemistö, 1992. Abstract: It is proposed an approximating method for optimal control problems governed by elliptic variational inequalities. Some applications and numerical examples are treated. *Nonconvex Optimal Control and Variational Problems* Alexander J. Zaslavski, 2013-06-12. *Nonconvex Optimal Control and Variational Problems* is an important contribution to the existing literature in the field and is devoted to the presentation of progress made in the last 15 years of research in the area of optimal control and the calculus of variations. This volume contains a number of results concerning well-posedness of optimal control and variational problems, nonoccurrence of the Lavrentiev phenomenon for optimal control and variational problems, and turnpike properties of approximate solutions of variational problems. Chapter 1 contains an introduction as well as examples of select topics. Chapters 2-5 consider the well-posedness condition using fine tools of

general topology and porosity Chapters 6 8 are devoted to the nonoccurrence of the Lavrentiev phenomenon and contain original results Chapter 9 focuses on infinite dimensional linear control problems and Chapter 10 deals with good functions and explores new understandings on the questions of optimality and variational problems Finally Chapters 11 12 are centered around the turnpike property a particular area of expertise for the author This volume is intended for mathematicians engineers and scientists interested in the calculus of variations optimal control optimization and applied functional analysis as well as both undergraduate and graduate students specializing in those areas The text devoted to Turnpike properties may be of particular interest to the economics community

OPTIMAL CONTROL, DIFFERENTIAL VARIATIONAL INEQUALITIES, AND THEIR APPLICATION TO TRAFFIC SCIENCE, REVENUE MANAGEMENT AND SUPPLY CHAINS. Yiou Wang,2018 Optimal control problems and differential Nash games have been employed by many scholars in the study of dynamic pricing supply chain management and transportation network flow problems This dissertation emphasizes the extension of frequently employed deterministic open loop modeling paradigms into feedback and stochastic cases respectively with a focus on the computational perspective For the feedback differential Nash games this dissertation briefly reviews the classical theory of Hamilton Jacobi Bellman equation and the general technique to synthesis feedback optimal control from its solution Such techniques are then applied to the investigation of a dynamic competitive pricing problem of perishable products with fixed initial inventories DPFI Other qualitative analysis and numerical extensions of the DPFI model are also provided In the study of differential Nash games with Ito type of stochastic dynamics this dissertation starts from reviewing the stochastic maximum principle It then proposes stochastic differential variational inequality S DVI as the necessary condition for stochastic differential Nash games As an application this dissertation provides formulation qualitative analysis and algorithm
