Optoelectronics Of GroupIVbased Materials:

Optoelectronics of Group-IV-based Materials Materials Research Society. Meeting,2003 Elemental semiconductors feature fundamental advantages when compared to II VI and III V compounds This is best illustrated by the success of silicon technology and also by the superior purity of germanium and MOCVD diamond However in contrast to electronic the optical properties of these materials are inferior and therefore their applications remain electronic rather than photonic Nevertheless an effort toward optoelectronics continues In the case of silicon and silicon based media this is motivated by the almost unlimited possibilities offered by VLSI technology Among other methods quantum confinement in low dimensional structures optical doping development of inhomogeneous media and applications of microcavities are being vigorously explored as ways to improve emission When brought to maturity these approaches could lead to widespread applications ranging from telecommunications to chemical and biological sensing For silicon a full on chip integration of electronic and photonic elements could be realized This volume brings together researchers from academic industry and government laboratories around the world to review progress in the field identify the most promising targets point out possible bottlenecks and assess future perspectives A cross fertilization of ideas from the fields of materials science spectroscopy solid state physics and chemistry as well as device physics are presented *Handbook of Silicon Photonics* Laurent Vivien,Lorenzo Pavesi,2016-04-19 The development of integrated silicon photonic circuits has recently been driven by the Internet and the push for high bandwidth as well as the need to reduce power dissipation induced by high data rate signal transmission To reach these goals efficient passive and active silicon photonic devices including waveguide modulators photodetectors *Materials and Devices for Smart Systems* Materials Research Society. Techniques: Volume 803 Materials Research Society. Meeting, 2004-04-28 The MRS Symposium Proceeding series is an internationally recognised reference suitable for researchers and practitioners **Materials Inspired by Biology** James L. Thomas (Ph. D.) Kristi L. Kiick, Laurie A. Gower, 2003 Continued interest in the field of biologically inspired materials is strongly motivated by the fact that the nanoscale and microscale organization found in biological materials often leads to exceptional macroscopic materials properties. The ability to mimic these structures should lead to new synthetic materials with similarly remarkable behavior in both biomedical and materials arenas. This has led to an enormous amount of research in a variety of materials areas including those aimed at 1 unique ceramics or composites for use in biomaterials magnetic and optical applications 2 self assembled biopolymeric systems for use in biomaterials and biosensor applications and 3 colloidal and amphiphilic systems for application in biomedicine nanotechnology and biosensors. Accordingly this volume brings together a broad range of researchers whose interests span the full breadth of biology and in addition those who find different inspiration in biology itself. For some that inspiration is in the creation of new materials that have important biological especially biomedical applications. For others it is the imitation of the behavior of a biological material molecule or process that is of interest. Finally with increasing frequency researchers are drawing inspiration from the synthetic pathways that biology uses exploiting these pathways and modifying them chemically or genetically to make entirely novel molecules and materials. Biologically inspired materials is a rapidly evolving arena of materials science research and the work presented here reflects recent advances and new perspectives in the field. Topics include tissue engineering and biomaterials novel biomimetic and bioinspired polymers biomineratization colloidal and templated materials and amphiphilic membranes and surfaces

Advanced Optical Processing of Materials Materials Research Society. Meeting, 2003 Since the inauguration of the MRS symposium series on advanced optical processing of materials back in 1990 the number of optical based techniques applied to process materials and the capabilities of optical systems has continued to expand and improve beyond simple pulsed laser deposition of thin films. In turn the scope of materials being investigated has also increased from oxide ceramics to include alloys polymers and bio materials. Many of the most exciting areas presented in this interdisciplinary forum include current and future applications in engineering materials at the mesoscopic to nanometer scale optoelectronics biomaterials sensors and electronics. Advanced optical processing of materials now includes laser interactions with materials that are specially designed to optimize the beneficial qualities of laser modification. However femtosecond processing of materials emerged as the dominant theme this year and several papers on this topic are featured. Another hot topic is one connected with biomedical applications the controlled delivery of drugs to increase their efficacy by coating a fluidized bed of drug powders with biodegradable polymers was realized by conventional pulsed laser deposition PLD and matrix assisted pulsed laser evaporation MAPLE or by microencapsulation
