ALGORITHMS IN ORDER RESTRICTED STATISTICAL INFERENCE AND THE CAUCHY MEAN VALUE PROPERTY[1]

By Tim Robertson and F. T. Wright

University of Iowa, University of Missouri-Rolla

Most algorithms in order restricted statistical inference express the estimates in terms of certain summary statistics computed from pooled samples. These algorithms may or may not yield optimal estimates depending on whether or not the Cauchy mean value property holds strictly for the summary statistics. In this paper a minimum lower sets algorithm, which holds generally, is described and used to prove the optimality of estimates described by a max-min formula.

1. **Introduction.** A number of estimates studied in order restricted statistical inference can be expressed using "max-min" formulas. These formulas are, perhaps, the most succinct way of describing these estimates and are used extensively in consistency proofs. However, these formulas are not very handy for the actual computation of the estimates. Moreover, optimality is generally argued by induction and other algorithms have proven to be more useful here. If the ordering is not linear a minimum lower sets algorithm (cf. Barlow et al. (1972)) has often been used for proving optimality. Such an algorithm was incorrectly stated in Theorem 2.4 of Robertson and Wright (1973) for a least absolute deviations problem. The proof given there implicitly uses the incorrect assumption that the median is a strict Cauchy mean value function. In this note we prove the optimality of estimates given by a max-min formula by developing an alternative (and much more complicated) minimum lower sets algorithm which is valid in a general setting, which includes the least absolute deviations problem and several other problems discussed in the literature.

2. **Algorithms.** Assume that we have samples from k distributions; that these distributions are indexed by what we shall refer to as observation points, s_1, $s_2, \cdots, s_k$, and that we wish to estimate a real valued parameter from each distribution, say $\theta(s_i)$, $i = 1, 2 \cdots, k$. We also assume that it is known a priori that each of the parameters belongs to a nondegenerate interval I and these parameters satisfy a certain order restriction such as, $\theta(s_1) \leqslant \theta(s_2) \leqslant \cdots \leqslant \theta(s_k)$. Thus, we are interested in estimates which satisfy these conditions.

We consider order restrictions that can be specified in terms of a partial order. In particular, with $\ll$ a partial order on $S = \{s_1, s_2, \cdots, s_k\}$, we consider the order

Order Restricted Statistical Inference Tim Robertson,F. T. Wright,Richard Dykstra,1988 This work attempts to provide a comprehensive treatment of the topic of statistical inference under inequality constraints in which much of the theory is based on the principles ofr maximum likelihood estimation and likelihood ratio tests   **Advances in Order Restricted Statistical Inference** Richard Dykstra,Tim Robertson,Farrol T. Wright,2012-12-06 With support from the University of Iowa and the Office of Naval Research a small conference on order restricted inference was held at the University of Iowa in Iowa City in April of 1981 There were twenty one participants mostly from the midwest and eleven talks were presented A highlight of the conference was a talk by D J Bartholomew on Reflections on the past and thoughts about the future The conference was especially valuable because it brought together researchers who were thinking about related problems A small conference on a limited topic is one of the best ways to stimulate research and facilitate collaboration Because of the success of the first conference a second conference was organized and held in September of 1985 This second conference was made possible again by support from the Office of Naval Research under Department of the Navy Contract NOOOI4 85 0161 and the University of Iowa There were thirty five participants and twenty presentations on a wide variety of topics dealing with order restricted inference at the second conference This volume is a collection of fourteen of those presentations By collecting together and organizing the fundamental results in order restricted inference in Statistical Inference under Order Restrictions R E Barlow D J Bartholomew J M Bremner and H D Brunk have done much to stimulate research in this area and so we wish to express our gratitude to them first   *Advances in Order Restricted Statistical Inference* Richard Dykstra,Tim Robertson,F. problems are pointed out Few complete proofs are given but outlines of proofs are often supplied The reader is always referred to the published papers and often results are clari ed by presenting examples of the kind of problems an author solves or of problems that cannot be solved by a particular result The monograph does not touch on the subject of testing hypotheses in stricted parameter spaces The latest books on that subject are by Robertson Wright and Dykstra 1988 and Akkerboom 1990 but many new results in that area have been obtained since The monograph does have a chapter in which questions about the existence of maximum likelihood estimators are discussed Some of their properties are also given there as well as some algorithms for computing them Most of these results cannot be found in the Robertson Wright Dykstra book
