Romanes presents a detailed examination of the evidence supporting Darwin's theory of evolution. Written in 1882, this work offers a comprehensive overview of the scientific arguments prevalent during that era. Romanes explores various aspects of evolutionary biology, including comparative anatomy, embryology, and paleontology, to build a case for the gradual development of species through natural selection. This book provides valuable insights into the historical context of evolutionary thought and the debates surrounding it. Romanes's methodical approach and clear writing make it accessible to both scientists and educated readers interested in the development of evolutionary theory. His work remains a significant contribution to the history of science and a testament to the enduring impact of Darwin's ideas. Excerpt from *Organic Evolution*: Until about one hundred years ago, it was all but universally believed that the different kinds of plants and animals, as men knew them, had existed as such from the beginning. The progeny of cows were always calves, of oaks always acorns. Cows and oaks had long been known, and if they had not changed in two thousand years, they doubtless had not changed in the six thousand years of the earth's history. Not only did animal and vegetable species breed true to their kind, but they did not breed among themselves; or if they did, the hybrid race was not perpetuated. Doubtless, therefore, cows had always been cows, and oaks oaks. But indeed, men had not been left to draw such an obvious inference, for there was extant a divinely inspired account of the origin of species, wherein it was authoritatively stated that they had been called into being by special creation. To-day, however, there triumphs, after a struggle of several decades, another theory, which goes by the name of organic evolution.
