ABSTRACT

Over periods of tens of thousands to millions of years, periodic changes of climate due to astronomically defined variations in the distribution of solar energy over the Earth are of influence upon the climate and upon oceanic circulation systems. This in turn may affect the production of carbonate and organic matter in marine surface waters and the oxidation and dissolution of these products in the deep ocean. Rhythmic variations in the flux of the resulting pelagic sediments are readily preserved in the deep oceanic record. However, similar reflections of regular, astronomically induced fluctuations of climate have been widely observed in other sedimentary environments, including glacial, lacustrine, fluvial, aeolian, deltaic, shallow marine, and submarine fan.

Periodic climatic and oceanographic changes and the resulting rhythmic sedimentation patterns can be preserved in the sedimentary record, providing that the sediment-supplying mechanisms (weathering and transport on the land, production of biogenic sediment in the ocean) as well as the relative sedimentary facies are sufficiently sensitive. Pelagic and lacustrine, and especially evaporitic, settings have proved to be sensitive to the influence of orbital forcing of climate. It is in such facies that, at the turn of the century, cyclicity in sedimentary sequences was recognized to be the result of orbital forcing (Gilbert, 1894; Bradley, 1929). Other sedimentary environments can be sensitive to such astronomically induced climatic variations in a similar way, but in many cases disturbing factors, such as variations in the rate of sedimentation and intermittent erosion, will obscure an otherwise clear record in the sedimentary column. Recognition of orbital cycles in environments other than the pelagic and lacustrine ones is of more recent date, but even coarse-grained alluvial fan and submarine fan environments can now be proven to bear the marks of orbitally induced climatic changes. Once demonstrated in the record, Milankovitch cycles have applications in assessing rates and durations of geological processes, and in the analysis of the palaeoclimate.

INTRODUCTION

This paper sets the scene of this book by reviewing the subject, and, without attempting to be comprehensive, at least indicating the range of studies that have been undertaken in recent years as part of the general revival of interest in the hypothesis that bears Milankovitch's name.

Astronomical forcing of climate and sedimentary facies depends upon the changing position of the Earth's axis in its varying path around the Sun (Fig. 1; Berger, 1977). Such variations depend on the interaction of gravitational forces in the rotating

Sun–Earth–Moon system, and on the influences of the other planets in our solar system. The precession (Fig. 1c) is the spinning of the Earth's axis due to the combined effects of the solar and lunar attraction on the equatorial bulge of the Earth. The absolute period of this cycle is of the order of 26 ka*. However, the elliptical orbit of the Earth also rotates, and the average main periods observed from the Earth are about 19 ka and 23 ka, with extremes of

* ka = 1000 years.

Orbital Forcing and Cyclic Sequences P. L. DeBoer,D. G. Cyclostratigraphy Michael Robert House,A. S. Gale,1995 The metronomic variations of the Earth Moon system and of the Earth Sun orbital patterns produce gravitational and temperature effects that alter the physical environment on the Earth s surface These give an interpenetrating effect of forcing cycles ranging from twice daily tides day night alternations various tidal patterns and the annual solar pattern All of these have been used palaeontologically to give precision to short term age determination in the past It is cycles of the Milankovitch band that are showing promise of enabling new practical timescales to be established for parts of the geological record These depend on changes in the Earth Sun distance and changes in the tilt of the Earth s axis with respect to the Earth s orbit round the Sun There is increasing evidence that small scale sedimentary rhythmic couplets may represent the effect of such changes The disentangling of the interpenetrating cycles to produce an orbital forcing timescale is an exciting problem and challenge for palaeobiology and sedimentology These should enable numerical dates to be given to bio and chronostratigraphical timescales and eventually enable many Earth processes

to be analysed in real time The papers in this volume represent major new developments in sedimentological palaeontological geochemical and stratigraphical research being undertaken in this field Provided by publisher Provided by publisher The Triassic Timescale Spencer G. Petroleum Geology of the Southern North Sea Karen Ziegler,Stephen R. Daines,P. Turner,Peter Turner,1997 *The Geology of Stratigraphic Sequences* Andrew D. Miall,2010-06-09 It has been more than a decade since the appearance of the First Edition of this book Much progress has been made but some controversies remain The original ideas of Sloss and of Vail building on the early work of Blackwelder Grabau Ulrich Levorsen and others that the stratigraphic record could be subdivided into sequences and that these sequences store essential information about basin forming and subsidence processes remains as powerful an idea as when it was first formulated The definition and mapping of sequences has become a standard part of the basin analysis process The main purpose of this book remains the same as it was for the first edition that is to situate sequences within the broader context of geological processes and to answer the question why do sequences form Geoscientists might thereby be better equipped to extract the maximum information from the record of sequences in a given basin or region Tectonic climatic and other mechanisms are the generating mechanisms for sequences ranging over a wide range of times scales from hundreds of millions of years to the high frequency sequences formed by cyclic processes lasting a few tens of thousands of years Three-dimensional Sequence Stratigraphy Offshore Louisiana, Gulf of Mexico (West Cameron 3D Seismic Data) Benoît Reymond,1994 Thèse Biologie M decine 1994 *Non-biostratigraphical Methods of Dating and*
