Developments in Geophysical Exploration Methods—4 A.A. Fitch, 2012-12-06 Geophysical prospecting is an applied science and the range of scientific principles to be applied is very wide In this collection of original papers the application of many different principles is described in the search for sulphides other metallic ores and radioactive deposits The papers are all concerned with surface observations and cover both the theory and the practice of the methods used In all cases the advantages and disadvantages of the methods are described and their role in the detection of mineral deposits is discussed and placed in context Electromagnetic methods are covered in detail involving the use of both electric and magnetic field effects Techniques are described involving observations both at a number of discrete frequencies and with continuously changing frequency In spite of the diversity of method it is interesting to note the strong links between the papers two chapters for example start from the same fundamental illustration first published by Won of the basic relationship between source frequency ground conductivity and depth of penetration The all important economic aspects are not forgotten and the first chapter assesses the statistics of performance and describes their use in the shaping and management of an exploration
