Pattern Detection and Discovery David J Hand, Niall, M. Adams, Richard J. Bolton, 2003-08-02 The collation of large electronic databases of scientific and commercial information has led to a dramatic growth of interest in methods for discovering structures in such databases These methods often go under the general name of data mining One important subdiscipline within data mining is concerned with the identification and detection of anomalous interesting unusual or valuable records or groups of records which we call patterns Familiar examples are the detection of fraud in credit card transactions of particular coincident purchases in supermarket transactions of important nucleotide sequences in gene sequence analysis and of characteristic traces in EEG records Tools for the detection of such patterns have been developed within the data mining community but also within other research communities typically without an awareness that the same problem was common to many disciplines This is not unreasonable each of these disciplines has a large literature of its own and a literature which is growing rapidly Keeping up with any one of these is difficult enough let alone keeping up with others as well which may in any case be couched in an unfamiliar technical language But of course this means that opportunities are being lost discoveries relating to the common problem made in one area are not transferred to the other area and breakthroughs and problem solutions are being rediscovered or not discovered for a long time meaning that effort is being wasted and opportunities may be lost
