Nonlinear Spectroscopy Of Solids Advances And Applications:

Nonlinear Spectroscopy of Solids Baldassare di Bartolo, 2013-11-21 This report presents an account of the course Nonlinear Spectroscopy of Solids Advances and Applications held in Erice Italy from June 16 to 30 1993 This meeting was organized by the International School of Atomic and Molecular Spectroscopy of the Ettore Majorana Centre for Scientific Culture The purpose of this course was to present and discuss physical models mathematical formalisms experimental techniques and applications relevant to the subject of nonlinear spectroscopy of solid state materials The universal availability and application of lasers in spectroscopy has led to the widespread observation of nonlinear effects in the spectroscopy of materials Nonlinear spectroscopy encompasses many physical phenomena which have their origin in the monochromaticity spectral brightness coherence power density and tunability of laser sources Conventional spectroscopy assumes a linear dependence between the applied electromagnetic field and the induced polarization of atoms and molecules The validity of this assumption rests on the fact that even the most powerful conventional sources of light produce a light intensity which is not strong enough to equalize the rate of stimulated emission and that of the experimentally observed decay A different situation may arise when laser light sources are used particularly pulsed lasers The use of such light sources can make the probability of induced emission comparable to or even greater than the probability of the observed decay in such cases the nonlinearity of the response of the system is revealed by the experimental data and new properties not detectable by conventional spectroscopy will emerge *Ultrafast Photonics* A. Miller, D.T. Reid, D.M. Finlayson, 2019-08-22 Ultrafast photonics has become an interdisciplinary topic of high international research interest because of the spectacular development of compact and efficient lasers producing optical pulses in the femtosecond range This book brings together contributions from experts at major research initiatives around the world to address all aspects of this very active field Topics covered range from the fundamental physics of optical interactions and material properties through to new system concepts for ultrahigh capacity data transfer and processing using femtosecond pulses with emphasis on areas of specific scientific breakthroughs and subsequent technological advances *Nano-Optics for Enhancing Light-Matter Interactions on a Molecular Scale* Baldassare Di Bartolo, John Collins, 2012-12-04 This volume presents a considerable number of interrelated contributions dealing with the new scientific ability to shape and control matter and electromagnetic fields on a sub wavelength scale The topics range from the fundamental ones such as photonic metamaterials plasmonics and sub wavelength resolution to the more applicative such as detection of single molecules tomography on a micro chip fluorescence spectroscopy of biological systems coherent control of biomolecules biosensing of single proteins terahertz spectroscopy of nanoparticles rare earth ion doped nanoparticles random lasing and nanocoax array architecture The various subjects bridge over the disciplines of physics biology and chemistry making this volume of interest to people working in these fields The emphasis is on the principles behind each technique and on examining the full potential
