Optimal Control Of Distributed Nuclear Reactors:

Optimal Control of Distributed Nuclear Reactors G.S. Christensen, S.A. Soliman, R. Nieva, 1990-01-31 This book is devoted to the mathematical optimization theory and modeling techniques that recently have been applied to the problem of controlling the shape and intensity of the power density distribution in the core of large nuclear reactors The book has been prepared with the following purposes in mind 1 To provide in a condensed manner the background preparation on reactor kinetics required for a comprehensive description of the main problems encountered in designing spatial control systems for nuclear reactor cores 2 To present the work that has already been done on this subject and provide the basic mathematical tools required for a full understanding of the different methods proposed in the literature 3 To stimulate further work in this challenging area by weighting the advantages and disadvantages of the existing techniques and evaluating their effectiveness and applicability In addition to coverage of the standard topics on the subject of optimal control for distributed parametersystems the book includes at a mathematical level suitable for graduate students in engineering discussions of concepts of functional analysis the representation theory of groups and integral equations Although these topics constitute a requisite for a full understanding of the new developments in the area of reactor modeling and control they are seldom treated together in a single book and when they are their presentation is often directed to the mathematician They are thus relatively unknown to the engineering community

Optimal Control of Nuclear Reactors Ronald R. Mohler, Chi-neng Shen, 1970 Optimal Control of Distributed Nuclear Reactors Using Functional Analysis Rolando Nieva Gómez, 1979 The minimum norm formalism of functional analysis is applied to the problem of controlling the neutron flux distribution in nuclear reactors The application of the optimization technique is first described in terms of a general linear distributed parameter model The general results thus obtained are later particularized to the specific case of a homogeneous slab reactor with the one energy neutronic model The reduction of distributed parameter systems into decoupled and more tractable subsystems is discussed It is demonstrated how symmetry principles can facilitate the practical implementation of the optimization techniques to more realistic distributed models which may include for example reactor configurations in two or three dimensions A new model expansion method is developed for solving the system of partial differential equations that describe the transient behavior of the most important fission product concentrations in thermal nuclear reactors
