Optoelectronic Integration Physics Technology And Applications:

Optoelectronic Integration: Physics, Technology and Applications Osamu Wada, 2013-11-27 As we approach the end of the present century the elementary particles of light photons are seen to be competing increasingly with the elementary particles of charge electrons holes in the task of transmitting and processing the insatiable amounts of information needed by society The massive enhancements in electronic signal processing that have taken place since the discovery of the transistor elegantly demonstrate how we have learned to make use of the strong interactions that exist between assemblages of electrons and holes disposed in suitably designed geometries and replicated on an increasingly fine scale On the other hand photons interact extremely weakly amongst themselves and all photonic active circuit elements where photons control photons are presently very difficult to realise particularly in small volumes Fortunately rapid developments in the design and understanding of semiconductor injection lasers coupled with newly recognized quantum phenomena that arise when device dimensions become comparable with electronic wavelengths have clearly demonstrated how efficient and fast the interaction between electrons and photons can be This latter situation has therefore provided a strong incentive to devise and study monolithic integrated circuits which involve both electrons and photons in their operation As chapter I notes it is barely fifteen years ago since the first demonstration of simple optoelectronic integrated circuits were realised using III-V compound semiconductors these combined either a laser driver or photodetector preamplifier combination

Microelectronic Interconnections and Assembly G.G. Harman, Pavel Mach, 2012-12-06 MICROELECTRONIC INTERCONNECTIONS AND MICROASSEMBLY WORKSHOP 18-21 May 1996 Prague Czech Republic Conference Organizers George Harman NIST USA and Pavel Mach Czech Republic Summary of the Technical Program Thirty two presentations were given in eight technical sessions at the Workshop A list of these sessions and their chairpersons is attached below The Workshop was devoted to the technical aspects of advanced interconnections and microassembly but also included papers on the education issues required to prepare students to work in these areas In addition to new technical developments several papers presented overviews predicting the future directions of these technologies The basic issue is that electronic systems will continue to be miniaturized and at the same time performance must continue to improve Various industry roadmaps were discussed as well as new smaller packaging and interconnection concepts The newest chip packages are often based on the selection of an appropriate interconnection method An example is the chip scale package which has horizontal x y dimensions 20% larger than the actual silicon chip itself The chip is often flip chip connected to a micro ball grid array but direct chip attach was described also Several papers described advances in the manufacture of such packages
