Organic Chemistry in Action F. Serratosa, 2013-10-22 Contrary to all other books in the field of organic synthesis this volume combines Corey's methodology which is based on the concept of synthon and retrosynthetic analysis with Evans methodology based on the Lapworth model of alternating polarities Using this approach the formation of carbon carbon bonds and the manipulation of functional groups are treated together whereas the stereochemical aspects are considered separately Emphasis is laid on the importance of rigid structures whether in the starting materials the synthetic intermediates or the transition states as a means of controlling the stereochemistry of the organic compounds Enclosed with the book is a copy of a miniprogram CHAOS for an IBM PC or fully compatible computers which is an interactive program affording the beginner a fast and easy way of learning exploring and looking for new synthetic schemes of molecules of moderate complexity As a textbook on organic synthesis this volume will be of immense value at university level
