**World Soil Resources Reports** ,1961 **Agroforestry for Soil Management** Anthony Young,1997 Agroforestry

refers to land use systems in which trees or shrubs are grown in association with agricultural crops or pastures and livestock. From its inception it has contained a strong element of soil management. Well designed and managed agroforestry systems have the potential to control run off and erosion, maintain soil organic matter and physical properties and promote nutrient cycling. By these means agroforestry can make a major contribution to sustainable land use. The previous edition of this book entitled *Agroforestry for Soil Conservation* 1989 was based on indirect evidence from agriculture, forestry and soil science. The present work provides a new synthesis drawing on over 700 published sources dating largely from the 1990s. These include both results of field trials of agronomy systems and research into the plant soil processes which take place within them. Soil conservation in its narrower sense, the control of erosion, is treated alongside other equally important aspects of soil management such as nutrient cycling. The new edition summarizes the present state of knowledge and indicates needs for research. It is essential reading for all concerned with agroforestry whether as students, research scientists or for practical purposes of development. It is also of interest to soil scientists, agronomists and foresters. Anthony Young was for nine years a Principal Scientist with the International Centre for Research in Agroforestry (ICRAF) Nairobi, Kenya. He was previously Professor of Environmental Sciences at the University of East Anglia, Norwich, UK, from which he received the degree of Doctor of Science. He was a joint author of the FAO standard texts on land evaluation and land use planning. Besides these his other books include *Soil Survey and Land Evaluation* 1981 and *Land Resources Now and for the Future* 1998. He is now Honorary Research Fellow in Environmental Sciences at the University of East Anglia. Soil fauna plays a significant role at all trophic levels of the soil food web and regulates processes that are crucial for soil functioning such as nutrient cycling, immobilization and/or degradation of toxic compounds, formation of soil structure, greenhouse gas emissions and C turnover. Although soil fauna is not thought to contribute significantly to soil respiration during litter or soil organic matter SOM decomposition, the diversity of soil fauna has been found to strongly influence SOM distribution and dynamics. Yet the functional contribution of soil fauna to many soil processes is not well understood due to methodological limitations and the high complexity of interactions at various spatiotemporal scales. In general, soil fauna has received far less scientific attention than bacteria and fungi and lately archaea in soil studies and has been regularly ignored in global biogeochemical models with maybe exceptions for some earthworms. However, recent studies are raising the awareness of the influence of soil fauna on ecosystems dynamics. For instance, earthworms have been found to be major players in N<sub>2</sub>O emissions from soils. They exert a strong influence on C stabilization and they promote the degradation of polycyclic aromatic hydrocarbons.

PAHs Less studied ants and termites have been found to increase crop productivity in drylands and different lifeforms of Collembola have been shown to impact microorganisms in various ways over time thereby potentially affecting C and N cycles within farming systems The influence of soil fauna indeed manifests over a broad ranges of spatiotemporal scales For example some effect such as aggregate formation may cumulate over time and finally contribute to the formation of whole soil profiles which serve as a framework for other soil processes such as water movement decomposition etc Meanwhile soil biodiversity is impacted by an increasing human pressure through deforestation agriculture intensification habitat fragmentation or climate change increasing temperatures extreme weather events which leads to soil biodiversity loss in particular of soil fauna with associated consequences on soil functioning and resilience Crop Residues in Sustainable Mixed Crop/livestock Farming Systems C.
