Lung Cancer: Basic and Clinical Aspects Heine Høi Hansen, 1986-04-30 Lung cancer is one of the biggest challenges in oncology today The challenge is due to the recognition of the possibility of prevention in at least 70-80 % of all the cases and the extreme difficulties encountered in the treatment of this neoplasm Despite the knowledge of prevention measures such as cessation of cigarette smoking the incidence continues to increase in many countries The increase is particularly notable in females in the westernized countries where the death rate in females in certain regions surpasses that of breast cancer Furthermore in many developing countries lung cancer is now being diagnosed with increasing frequency in both sexes and it is expected to be a major cause of death in those countries later in this century or the beginning of next century if the tobacco consumption will continue its rapid rise With respect to therapy the 1970s brought considerable progress in understanding of the clinical behaviour of lung cancer thereby establishing the importance of distinguishing between the major histologic types Therapeutic advancement was particularly experienced in small cell carcinoma with the introduction of combination chemotherapy after this special disease entity among lung cancers was recognized as being a disseminated disease in almost all cases at the time of diagnosis It was expected that the improvement in therapy would have continued in the early 1980s not only for small cell lung cancer but also for the other cell types *Johns Hopkins Patients' Guide to Lung Cancer* Justin F. Lung Cancer: David J. Stewart, 2010-03-10 Defining the Lung Cancer Problem 1 Lung cancer is the leading cause of cancer death in the world It kills almost as many Americans as cancers of the breast prostate colon rectum pancreas and 2 kidney combined and accounts for 28.6% of all US cancer deaths With an increase in the 5 year relative survival rate from 13% to only 16% in the more than 230 years from 1974 to the present it will take us another 840 years to eradicate lung cancer deaths if we do not improve the current rate of progress As discussed in this text lung cancer prevention has received substantial attention The decrease in smoking in recent decades has helped but smoking is not the only problem Lung cancer in people who have never smoked is currently the 5th leading cause of cancer death in the United States Several factors contribute to the lethality of lung cancer including the rapidity of tumor growth advanced stage at diagnosis due to nonspecificity of early symptoms and the uncertain efficacy of screening early development of metastases and resistance to therapy Several chapters in this book discuss new molecular targets that may be potentially exploitable in the future as well as discussing our track record to date in exploiting them
