

Governing equation for soliton is nonlinear Schrödinger equation

$$\frac{dU}{dx} + \beta_1 \frac{dU}{dt} + \frac{\beta_2}{2} \frac{d^2U}{dt^2} + \frac{\alpha}{2} U = i\gamma |U|^2 U$$

This equation can reduce and also can be written as:

$$iq_x + \alpha q_{xx} + \mu |q|^2 q = 0$$

Where:

• α = Group velocity dispersive coefficient

• μ = Kerr nonlinearity coefficient.

Nonlinear Schrodinger Equation:

Schrödinger Equations in Nonlinear Systems Wu-Ming Liu,Emmanuel Kengne,2019-03-20 This book explores the diverse types of Schrödinger equations that appear in nonlinear systems in general with a specific focus on nonlinear transmission networks and Bose Einstein Condensates In the context of nonlinear transmission networks it employs various methods to rigorously model the phenomena of modulated matter wave propagation in the network leading to nonlinear Schrödinger NLS equations Modeling these phenomena is largely based on the reductive perturbation method and the derived NLS equations are then used to methodically investigate the dynamics of matter wave solitons in the network In the context of Bose Einstein condensates BECs the book analyzes the dynamical properties of NLS equations with the external potential of different types which govern the dynamics of modulated matter waves in BECs with either two body interactions or both two and three body interatomic interactions It also discusses the method of investigating both the well posedness and the ill posedness of the boundary problem for linear and nonlinear Schrödinger equations and presents new results Using simple examples it then illustrates the results on the boundary problems For both nonlinear transmission networks and Bose Einstein condensates the results obtained are supplemented by numerical calculations and presented as figures

Global Solutions of Nonlinear Schrödinger Equations Jean Bourgain, [The Nonlinear Schrodinger Equation](#),1995 **The Nonlinear Schrödinger Equation** Catherine Sulem,Pierre-Louis Sulem,2007-06-30 Filling the gap between the mathematical literature and applications to domains the authors have chosen to address the problem of wave collapse by several methods ranging from rigorous mathematical analysis to formal asymptotic expansions and numerical simulations

An introduction to nonlinear Schrödinger equations Thierry Cazenave,1993 *Korteweg-de Vries and Nonlinear Schrödinger Equations: Qualitative Theory* Peter E. Zhdikov,2001-04-24 The emphasis of this book is on questions typical of nonlinear analysis and qualitative theory of PDEs The selection of the material is related to the author's attempt to illuminate those particularly interesting questions not yet covered in other monographs though they have been the subject of published articles One

chapter for example is devoted to the construction of invariant measures for dynamical systems generated by certain equations and a result from a recent paper on basic properties of a system of eigenfunctions of a stationary problem Also considered is an application of the method of qualitative theory of ODEs to proving the existence of radial solutions of stationary problems and stability of solutions of NLSE nonvanishing as the spatial variable tends to infinity Finally a recent result on the existence of an infinite sequence of invariant measures for the integrable KdV equation is presented

Semi-classical Analysis For Nonlinear Schrodinger Equations: Wkb Analysis, Focal Points, Coherent States (Second Edition) Remi Carles,2020-10-05 The second edition of this book consists of three parts The first one is dedicated to the WKB methods and the semi classical limit before the formation of caustics The second part treats the semi classical limit in the presence of caustics in the special geometric case where the caustic is reduced to a point or to several isolated

points The third part is new in this edition and addresses the nonlinear propagation of coherent states The three parts are essentially independent Compared with the first edition the first part is enriched by a new section on multiphase expansions in the case of weakly nonlinear geometric optics and an application related to this study concerning instability results for nonlinear Schrödinger equations in negative order Sobolev spaces The third part is an overview of results concerning nonlinear effects in the propagation of coherent states in the case of a power nonlinearity and in the richer case of Hartree like nonlinearities It includes explicit formulas of an independent interest such as generalized Mehler's formula generalized lens transform

Semiclassical Soliton Ensembles for the Focusing Nonlinear Schrödinger Equation Spyridon

Kamvissis,Kenneth D.T-R McLaughlin,Peter D. Miller,2003-08-18 This book represents the first asymptotic analysis via completely integrable techniques of the initial value problem for the focusing nonlinear Schrödinger equation in the semiclassical asymptotic regime This problem is a key model in nonlinear optical physics and has increasingly important applications in the telecommunications industry The authors exploit complete integrability to establish pointwise asymptotics for this problem's solution in the semiclassical regime and explicit integration for the underlying nonlinear elliptic partial differential equations suspected of governing the semiclassical behavior In doing so they also aim to explain the observed gradient catastrophe for the underlying nonlinear elliptic partial differential equations and to set forth a detailed pointwise asymptotic description of the violent oscillations that emerge following the gradient catastrophe To achieve this the authors have extended the reach of two powerful analytical techniques that have arisen through the asymptotic analysis of integrable systems the Lax Levermore Venakides variational approach to singular limits in integrable systems and Deift and Zhou's nonlinear Steepest Descent Stationary Phase method for the analysis of Riemann Hilbert problems In particular they introduce a systematic procedure for handling certain Riemann Hilbert problems with poles accumulating on curves in the plane This book which includes an appendix on the use of the Fredholm theory for Riemann Hilbert problems in the Hörder class is intended for researchers and graduate students of applied mathematics and analysis especially those with an interest in integrable systems nonlinear waves or complex analysis

It was formulated in late 1925 and published in 1926 by the Austrian physicist Erwin Schrödinger. In classical mechanics the equation of motion is Newton's second law and equivalent formulations are the Euler-Lagrange equations and Hamilton's equations. In all these formulations they are used to solve for the motion of a mechanical system and mathematically predict what the system will do at any time beyond the initial settings and configuration of the system. In quantum mechanics the analogue of Newton's law is Schrödinger's equation for a quantum system usually atoms, molecules and subatomic particles free, bound or localized. It is not a simple algebraic equation but in general a linear partial differential equation. The differential equation describes the wavefunction of the system also called the quantum state or state vector. In the standard interpretation of quantum mechanics the wavefunction is the most complete description that can be given to a physical system. Solutions to Schrödinger's equation describe not only molecular, atomic and subatomic systems but also macroscopic systems possibly even the whole universe. Like Newton's Second law the Schrödinger equation can be mathematically transformed into other formulations such as Werner Heisenberg's matrix mechanics and
