## Nonlocal Bifurcations:

*Nonlocal Bifurcations I* [U]. S. Il'iashenko, Weigu Li, 1999 This book studies nonlocal bifurcations that occur on the boundary of the domain of Morse Smale systems in the space of all dynamical systems. These bifurcations provide a series of fascinating new scenarios for the transition from simple dynamical systems to complicated ones. The main effects are the generation of hyperbolic periodic orbits, nontrivial hyperbolic invariant sets, and the elements of hyperbolic theory. All results are rigorously proved and exposed in a uniform way. The foundations of normal forms and hyperbolic theories are presented from the very first stages. The proofs are preceded by heuristic descriptions of the ideas. The book contains new results and many results have not previously appeared in monograph form.

*New Methods for Chaotic Dynamics* Nikolai Aleksandrovich Magnitskii, Sergey Vasilevich Sidorov, 2006 This book presents a new theory on the transition to dynamical chaos for two-dimensional nonautonomous and three-dimensional many-dimensional and infinitely-dimensional autonomous nonlinear dissipative systems of differential equations, including nonlinear partial differential equations and differential equations with delay arguments. The transition is described from the Feigenbaum cascade of period doubling bifurcations of the original singular cycle to the complete or incomplete Sharkovskii subharmonic cascade of bifurcations of stable limit cycles with arbitrary period and finally to the complete or incomplete homoclinic cascade of bifurcations. The book presents a distinct view point on the principles of formation scenarios of occurrence and ways of control of chaotic motion in nonlinear dissipative dynamical systems. All theoretical results and conclusions of the theory are strictly proved and confirmed by numerous examples, illustrations, and numerical calculations. **Bifurcation Theory** Ale Jan Homburg, Jürgen Knobloch, 2024-12-02 This textbook provides a thorough overview of bifurcation theory. Assuming some familiarity with differential equations and dynamical systems, it is suitable for use on advanced undergraduate and graduate level and can in particular be used for a graduate course on bifurcation theory. The book combines a solid theoretical basis with a detailed description of classical bifurcations. It is organized in chapters on local, nonlocal, and global bifurcations, a number of appendices develop the toolbox for the study of bifurcations. The discussed local bifurcations include saddle node and Hopf bifurcations, as well as the more advanced Bogdanov-Takens and Neimark-Sacker bifurcations. The book also covers nonlocal bifurcations, discussing various homoclinic bifurcations and it surveys global bifurcations and phenomena such as intermittency and period doubling cascades. The book develops a broad range of complementary techniques, both geometric and analytic, for studying bifurcations. Techniques

include normal form methods center manifold reductions the Lyapunov Schmidt construction cross coordinate constructions Melnikov's method and Lin's method Full proofs of the results are provided also for the material in the appendices This includes proofs of the stable manifold theorem of the center manifold theorem and of Lin's method for studying homoclinic bifurcations

Deterministic Nonlinear Systems Vadim S. Anishchenko, Tatyana E.

Vadivasova, Galina I. Strelkova, 2014-06-16 This text is a short yet complete course on nonlinear dynamics of deterministic systems Conceived as a modular set of 15 concise lectures it reflects the many years of teaching experience by the authors The lectures treat in turn the fundamental aspects of the theory of dynamical systems aspects of stability and bifurcations the theory of deterministic chaos and attractor dimensions as well as the elements of the theory of Poincare recurrences Particular attention is paid to the analysis of the generation of periodic quasiperiodic and chaotic self sustained oscillations and to the issue of synchronization in such systems This book is aimed at graduate students and non specialist researchers with a background in physics applied mathematics and engineering wishing to enter this exciting field of research

**Dynamical Systems** V.V.I. Arnold, V.S. Afraimovich, Yu.S. Il'yashenko, L.P. Shil'nikov, 2013-12-01 Bifurcation theory and catastrophe theory are two well known areas within the field of dynamical systems Both are studies of smooth systems focusing on properties that seem to be manifestly non smooth Bifurcation theory is concerned with the sudden changes that occur in a system when one or more parameters are varied Examples of such are familiar to students of differential equations from phase portraits Understanding the bifurcations of the differential equations that describe real physical systems provides important information about the behavior of the systems Catastrophe theory became quite famous during the 1970's mostly because of the sensation caused by the usually less than rigorous applications of its principal ideas to hot topics such as the characterization of personalities and the difference between a genius and a maniac Catastrophe theory is accurately described as singularity theory and its genuine applications The authors of this book previously published as Volume 5 of the Encyclopaedia have given a masterly exposition of these two theories with penetrating insight
