Esogbue,GEORGIA INST OF TECH ATLANTA SCHOOL OF INDUSTRIAL AND SYSTEMS ENGINEERING.,1983 This report discusses the research conducted by the research team at the Georgia Institute of Technology in the area of nonserial dynamic programming networks The problems approach and major results are summarized in Chapter 1 while the rest of the chapters discuss in detail the algorithm developments experiment with sample problems and algorithmic complexities Each chapter contains detailed computer flow charts for the algorithms developed Chapter 6 employs an efficient dimensionality reduction algorithms known as the imbedded state space method in conjunction with the one developed in this study to treat an otherwise intractable problem involving feedforward loop systems These algorithms are useful inputs to the development of dynamic programming based strategies for the analysis of complex nonserial networks

Heuristic Nonserial Dynamic Programming for Large Problems Michael A. Rosenman,John S. Gero,1980 Dynamic programming is an extremely powerful optimization approach used for the solution of problems which can be formulated to exhibit a serial stage state structure However many design problems are not serial but have highly connected interdependent structures Existing methods for the solution of nonserial problems require the problem to possess a certain structure or limit the size of the problem due to storage and computational time requirements The aim of this paper is to show that nonserial problems can be solved by the use of dynamic programming incorporating algorithms based on heuristics Two such algorithms are developed using artificial intelligence concepts of estimating the likelihood of future results on present decisions The algorithms are explained in detail A small problem is solved and the results of testing them on large scale problems are given The method is then used to solve a problem drawn from the literature **Nonserial Dynamic**

Esogbue,I. Nabeshima,2014-05-20 *Mathematical Aspects of Scheduling and Applications* addresses the perennial problem of optimal utilization of finite resources in the accomplishment of an assortment of tasks or objectives The book provides ways to uncover the core of these problems presents them in mathematical terms and devises mathematical solutions for them The book consists of 12 chapters

Chapter 1 deals with network problems the shortest path problem and applications to control theory Chapter 2 stresses the role and use of computers based on the decision making problems outlined in the preceding chapter Chapter 3 classifies scheduling problems and their solution approaches Chapters 4 to 6 discuss machine sequencing problems and techniques Chapter 5 tackles capacity expansion problems and introduces the technique of embedded state space dynamic programming for reducing dimensionality so that larger problems can be solved Chapter 6 then examines an important class of network problems with non serial phase structures and exploits dimensionality reduction techniques such as the pseudo stage concept branch compression and optimal order elimination methods to solve large scale nonlinear network scheduling problems Chapters 7 to 11 consider the flow shop scheduling problem under different objectives and constraints Chapter 12 discusses the job shop scheduling problem The book will be useful to economists planners and graduate students in the fields of mathematics operations research management science computer science and engineering
