Verselbständigungsprozesse

internationaler Organisationen Martin Koch, 2008-06-26 The fact is that it was only at the end of the Napoleonic wars that the emperors and statesmen began to think and to talk of some form of international organisation instead of war and offensive alliances as a practical method of structuring international society. Woolf, 1916, 23. 1. Internationale Organisationen sind in der öffentlichen Wahrnehmung so präsent wie selten zuvor. Gleichzeitig werden sie verstärkt als Forschungsgegenstand wieder entdeckt, nicht zuletzt weil ihnen wieder ein zunehmendes Mass an Einfluss auf die Gestaltung zwischenstaatlicher Beziehungen zugesprochen wird. Neben dem sprunghaften quantitativen Anstieg internationaler Organisationen seit dem Ende des 2. Weltkriegs (Rochester, 1986) und der Beobachtung, dass sich zunehmend staatliche und nicht staatliche Akteure in internationalen Organisationen organisieren (Jacobson, Reisinger et al, 1986), lässt sich die Präsenz internationaler Organisationen vor allem daran ablesen, dass in nahezu allen internationalen Politikfeldern neben Staaten auch internationale Organisationen aktiv sind und unterschiedliche Aufgaben übernehmen. Karns, Mingst, 2004; Reinhilda, 1999; Finnemore, 2004. Über die reine Koordinationsfunktion an Schnittstellen zwischen Staaten hinweg ist eine Zunahme und Verdichtung von Aufgaben und Kompetenzen nachweisbar; die internationalen Organisationen übertragen werden. Alvarez, 2006. Auf diese Weise wird der Aktionsrahmen internationaler Organisationen ausgebaut, indem diese beispielsweise als Mittler zwischen streitenden Staaten fungieren, als Informationspool dienen, Überwachungsmechanismen etablieren (Jacobson, 1984) und Sanktionen verhängen oder legitimieren (Drenzer, 2000). Internationale Organisationen können somit qua ihrer Funktion zu partiell selbstigen Akteuren avancieren, die das mitgliedstaatliche Verhalten beeinflussen bzw. eine überstaatliche Ordnungsebene ausbilden können.

Optimal Spatial Interaction and the Gravity Model Sven Erlander, 1980-02. This book has grown out of a desire to explore the possibilities of using optimizing models in transportation planning. This approach has been followed throughout. Models which combine descriptive and optimizing elements are not treated. The gravity model is here studied as the solution to an optimizing model. In spite of this approach, much of the material should be of general interest. Algorithms are not discussed. The author has benefited from discussions with many colleagues. M. Florian suggested the term 'interaction' and N. F. Stewart and P. Smeds gave many valuable comments on a first draft. M. Beckmann made me think

once more about the final chapters R Grubbstrem and K Jornsten helped clarifYing some things in the same chapters Remaining insufficiencies are due to the author Gun Mannervik typed with great patience Linkoping in October 1979 Sven Erlander ABSTRACT The book proposes extended use of optimizing models in transportation plann ing An entropy constrained linear program for the trip distribution problem is formulated and shown to have the ordinarJ doubly constrained gravity model as its solution Entropy is here used as a measure of interactivity which is constrained to be at a prescribed level In this way the variation present in the reference trip matrix is preserved The properties of entropy as a dispersion measure are shortly discussed The detailed mathematics of the optimal solutions as well as of sensitivity and duality are given

Fundamentals of Production Theory Rolf Färe,1988-07-27 This graduate text develops production theory from a set of reasonable axioms The theory is presented both in a primal and dual as well as in an indirect constrained framework The basic model leads to a set of efficiency measures which can be readily employed in empirical work A first draft of the text was used to teach students at Vanderbilt University The text includes a variety of exercise problems Plural Rationality and Interactive Decision Processes M. Grauer,Michael Thompson,Andrzej Wierzbicki,A. P. Wierzbicki,1985 Essays and Surveys on Multiple Criteria Decision Making P. Hansen,1983-02 The Fifth International Conference on Multiple Criteria Decision Making not surprisingly had several objectives First it aimed at being a forum for exchange and intensive discussion of recent ideas on theory and practice of MCDM following the now well established tradition of the previous meetings in the series organized by H Thiriez and S Zonts in Jouy en Josas 1975 S Zonts in Buffalo 1977 G Fandel and T Gal in Hagen Konigswinter 1979 and J Morse in Newark 1980 Second closer contacts Nere desired between participants in these meetings and other active groups in the field prominent among which is the European Working Group on Multiple Criteria Decision Aid Third participation of senior or junior researchers who had recently developped important new methodolo0ies such as the Analytical Hierarchy Process was actively sought for Fourth a synthesis of the rapidly expanding field of MCDM was to be made through selective surveys by leading researchers in the various areas it comprises Fifth cross fertilization and multidisciplinary research was to be encouraged through presentations on the connections between MCDM and mathematics economics game theory computer science and other subjects Sixth much emphasis was to be given to real world applications of MCDM particularly large scale ones and or pioneering work in new fields The present volume reflects the general agreement observed among participants that these goals were largely attained A Course in Triangulations for Solving Equations with Deformations B. C. Eaves,1984-11 Key to Economic Science and Managerial Sciences ,1979 Semi monthly review with annual indexes of abstracts on economics finance trade industry foreign aid management marketing labour

The Capacity Aspect of Inventories Roland Bemelmans,1986-04 Controlling the production in an industrial organisation is very complex There are two different reasons for this complexity On the one hand complexity is due to the variety in range and in level of detail of the activities that play a role in such a control think of manufacturing process

development capacity planning coordinating the flow of material through the production process releasing of workorders and scheduling On the other hand the production process itself may be complex many products many stages complex interrelationships between resources and uncertainty in the availability of resources To deal with the first cause for complexity one creates different but coordinated levels of control At each of these levels a specific part of the control of the production process is accounted for see Anthony 3 To deal with the second cause for complexity one groups manufacturing steps into so called production units see Bertrand 8 Each production unit is responsible for a specific part of the production process Of course these production units have to be coordinated to ensure that the products are manufactured timely and efficiently This activity will be referred to as material coordination see Bertrand 8

Optimality in Infinite Horizon

Economics Anders Borglin,Hans Keiding,1986-05 Modern welfare economics as it is known today to economists took its final shape with the emergence of the Arrow Debreu model The classical conjectures about the beneficent workings of markets together with the converse statement that optimal in the sense of Pareto allocations may be sustained by prices and markets has laid a firm foundation for further research in welfare economics But more than that it has inspired researchers to take up entirely new topics notably by closer considerations of situations where the assumptions of the original model may seem overly restrictive One of these new directions has been connected with generalizing the model so that it takes into account the possibility of infinitely many commodities On the face of it the idea of an infinity of commodities may seem a mathematical fancy having no real counterpart in economic life This is not so however Quite to the contrary infinity enters in a very natural way when it is taken into account that economic transactions take place over time 2 In the Arrow Debreu formalism time may be incorporated into the model in a very simple way using dated commodities Thus two commodities are considered as being different if they are to be delivered at different points of time

Selected Topics in Operations

Research and Mathematical Economics G. Hammer,Diethard Pallaschke,1984-04 Let eRN be the usual vector space of real N uples with the usual inner product denoted by $\langle \cdot, \cdot \rangle$ In this paper P is a nonempty compact polyhedral set of mN f is a real valued function defined on RN continuously differentiable and fP is the line ly constrained minimization problem stated as $\min f(x) \mid x \in P$ For computing stationary points of problem f we propose a method which attempts to operate within the linear simplex method structure This method then appears as a same type of method as the convex simplex method of Zangwill 6 It is however different and has the advantage of being less technical with regards to the Zangwill method It has also a simple geometrical interpretation which makes it more understandable and more open to other improvements Also in the case where f is convex an implementable line search is proposed which is not the case in the Zangwill method Moreover if $f(x) \leq c(x)$ this method will coincide with the simplex method this is also true in the case of the convex simplex method i if $f(x) \leq c(x)$ 12 it will be almost the same as the algorithm given by Bazaraa Goode Rardin 2

Estimation of Disequilibrium Models

Hans-Jürg Büttler, Gertrud Frei, Bernd Schips, 1986-10 This monograph grew out of a project which was sponsored by the

Swiss National Foundation Schweizerischer Nationalfonds under grant no 4 636 0 83 09 Within this project prediction oriented estimation methods for the canonical econometric disequilibrium model were developed The present monograph deals with the application of these estimation techniques to three aggregative markets of the Swiss economy Parts of the monograph have been presented at various places the estimation techniques described in chapter 3 at the European Meeting of the Econometric Society Madrid 1984 the application to residential investment described in chapter 4 at a symposium on housing policy at the University of Mannheim 1984 the empirical study on the money stock described in chapter 5 at the Symposium on Money Banking and Insurance held at the University of Karlsruhe 1984 as well as at a joint seminar of the University of Basle and the Bank for International Settlements BIS 1985 and finally the empirical study on the aggregate labor market described in chapter 6 at a seminar of the University of Zurich 1985 Comments from the seminar participants in particular from Palle S Andersen BIS who served as a discussant Pascal Bridel Swiss National Bank SNB Franz Ettlin SNB and Kurt Schiltknecht Nordfinanz Bank Zurich are gratefully acknowledged without implying any responsibility on their part The methodological part described in chapters 2 and 3 is contributed by G Frei and B *Studies in Austrian Capital Theory, Investment, and Time* P. Bernholz, 1986-10 The neglect of time in general and of the time structure of production in particular in mainstream economics led to the rebirth of the Austrian tradition in the seventies The names of BERNHOLZ HICKS KIRZNER and VON WEIZSACKER are representative of different approaches In 1979 my Introduction to Modern Austrian Capital Theory appeared in which I unified various papers BERNHOLZ and I had written I also linked our approach to those of VON NEUMANN of HICKS and of neoclassical capital theory These Studies supplement and continue my Introduction in various ways With all the authors of the present volume I have cooperated for several years This volume is subdivided into five parts The first one Historical Perspectives gives first an outline on the development of Austrian capital theory from its origins to the present Next it relates Modern Austrian Capital Theory to SRAFFA's theory and to the Austrian subjectivists pure time preference theory of interest The latter theory is represented in its opposition to the traditional productivity cum time preference explanation of interest which is common to neoclassical and BOHM BAWERKian capital theory alike The Austrian subjectivist pure time preference theory has been misinterpreted in its recent presentation which has led to misunderstandings It is shown that there is no real contradiction between the two approaches **Business Cycle Theory** Günter Gabisch, Hans-Walter Lorenz, 1987 *Dynamical Systems* Alexander B. Kurzhanski, Karl Sigmund, 1987-04-08 The investigation of special topics in systems dynamics uncertain dynamic processes viability theory nonlinear dynamics in models for biomathematics inverse problems in control systems theory has become a major issue at the System and Decision Sciences Research Program of the International Institute for Applied Systems Analysis The above topics actually reflect two different perspectives in the investigation of dynamic processes The first motivated by control theory is concerned with the properties of dynamic systems that are stable under variations in the systems parameters This allows us to specify classes of

dynamic systems for which it is possible to construct and control a whole tube of trajectories assigned to a system with uncertain parameters and to resolve some inverse problems of control theory within numerically stable solution schemes The second perspective is to investigate generic properties of dynamic systems that are due to nonlinearity as bifurcations theory chaotic behavior stability properties and related problems in the qualitative theory of differential systems Special stress is given to the applications of non linear dynamic systems theory to biomathematics and ecoloey

GERT Networks and the Time-Oriented Evaluation of Projects

K. Neumann,U. Steinhardt,1979-10 Towards the end of the fifties methods for planning scheduling and control of proj ects were developed on the basis that the evolution of a project can be associated with a special weighted directed graph called activity network In this association the individual activities of the project correspond to the arcs the so called proj ect events beginning or termination of activities correspond to the nodes and the durations of the activities correspond to the weights of the respective arcs of the directed graph 1 Contiguous arcs are assigned to activities which succeed one another immediately The event corresponding to a node occurs exactly at the time at which all activities which are associated with the arcs leading into the node are terminated After the occurrence of an event all those activities are be gun which correspond to the arcs emanating from the respective node This implies especially that the evolution of the project has to be uniquely determined before hand that every activity and every event are realized exactly once during the exe cution of the project and that feedback corresponding to cycles in the asso ciated network is not permitted Many projects for example most R D projects and projects in the area of production p 1 anni ng do not sa ti sfy the foregoing restrictions
