Tetrahedron Reports on Organic Chemistry Volume 3 contains 10 tetrahedron reports on organic chemistry with report numbers 21-30. Some reports focus on synthetic uses of anodic substitution reactions, an empirical analysis of the circular dichroism of chiral olefins, structure and reactivity of cycloimmonium ylides, the mechanism of epoxidation of olefins by peracids, regiospecific preparation and synthetic uses of ketone enolates. Other tetrahedron reports center on aspects of the formation and use of Stenhouse salts and related compounds, synthesis of macrolides, interesting aspects of marine natural products chemistry, participation of isomeric tRNAs in the partial reactions of protein biosynthesis, biosynthesis of lactam antibiotics. Solomons, 2004-06-01 Advanced Organic Chemistry Francis A. Carey, Richard J. Sundberg, 2012-12-06 The main theme of Part B is the description of synthetically useful reactions and the illustration of their application. We have attempted to update the material to reflect the most important advances in synthetic methodology. Because of the extensive developments in the use of organic derivatives of transition metals as well as of silicon and tin we have separated the organometallic material into three chapters. Chapter 7 emphasizes organolithium and organomagnesium chemistry and also considers the group IIB metals. Transition metal chemistry is discussed in Chapter 8 with emphasis on copper and palladium intermediates. In Chapter 9 the carbon-carbon bond forming reactions of organoboranes, silanes, and stannanes are discussed. The increased importance of free radical reactions in synthesis has led to the incorporation of a section on radical reactions into Chapter 10 in which carbocations, carbenes, and nitrenes are also discussed. Certainly a major advance in synthetic chemistry during the 1980s was the development of methods for enantioselective synthesis. We have increased the level of attention to stereochemistry in the discussion of many reactions. In areas in which new stereoselective methods have been well developed such as in aldol condensations, hydroboration, catalytic reduction, and epoxidation we discuss these methods. The final chapter discusses some of the general issues which must be addressed in multistep synthesis and provides some illustrative syntheses which can provide the basis for more detailed study of this aspect of synthetic chemistry.
