## Mapping And Spatial Modelling For Navigation:

**Mapping and Spatial Modelling for Navigation** Louis F. Pau,2012-12-06 The successful implementation of applications in spatial reasoning requires paying attention to the representation of spatial data In particular an integrated and uniform treatment of different spatial features is necessary in order to enable the reasoning to proceed quickly Currently the most prevalent features are points rectangles lines regions surfaces and volumes As an example of a reasoning task consider a query of the form find all cities with population in excess of 5 000 in wheat growing regions within 10 miles of the Mississippi River Note that this query is quite complex It requires processing a line map for the river creating a corridor or buffer to find the area within 10 miles of the river a region map for the wheat and a point map for the cities Spatial reasoning is eased by spatially sorting the data i e a spatial index In this paper we show how hierarchical data structures can be used to facilitate this process They are based on the principle of recursive decomposition similar to divide and conquer methods In essence they are used primarily as devices to sort data of more than one dimension and different spatial types The term quadtree is often used to describe this class of data structures In this paper we focus on recent developments in the use of quadtree methods We concentrate primarily on region data For a more extensive treatment of this subject see SameS4a SameSSa SameSSb SameSSc SameSga SameSgbj     *Mapping and Spatial Modelling for Navigation* L.
