## **Nonarchimedean Utility Theory:**

**Non-Archimedean Utility Theory** Heinz J. Skala, 2012-12-06 My interest in non Archimedean utility theory and the problems related to it was aroused by discussions which I have had with Professors Werner Leinfellner and G nter Menges On the occasion of the Second Inter national Game Theory Workshop Berkeley 1970 which was sponsored by the National Science Foundation I had the opportunity to report about a result on non standard utilities Work on this subject continued when I was a research assistant of Professor G nter Menges at the Uni versity of Heidelberg The present mono graph is essentially a translation of my habilitation thesis which was accepted on February 15 1973 by the Faculty of Economics and Social Sciences at the Universtity of Heidelberg On translating my thesis I took up some suggestions made by Professor Werner B ge from the Faculty of Mathematics at the Uni versity of Heidelberg Through lack of time many of his ideas have not been taken into consideration but I hope to do so in a future paper The first chapter should be considered as a short introduction to pref erence orderings and to the notion of a utility theory proposed by Dana Scott and Patrick Suppes In the second chapter I discuss in some detail various problems of ordinal utility theory Except when introducing non standard models of the reals no use is made of concepts of model theory This is done in deference to those readers who do not wish to be troubled by formal languages and model theory

*Axiomatic Utility Theory under Risk* Ulrich Schmidt, 2012-12-06 The first attempts to develop a utility theory for choice situations under risk were undertaken by Cramer 1728 and Bernoulli 1738 Considering the famous St Petersburg Paradox a lottery with an infinite expected monetary value Bernoulli 1738 p 209 observed that most people would not spend a significant amount of money to engage in that gamble To account for this observation Bernoulli 1738 pp 199 201 proposed that the expected monetary value has to be replaced by the expected utility moral expectation as the relevant criterion for decision making under risk However Bernoulli s 2 argument and particularly his choice of a logarithmic utility function seem to be rather arbitrary since they are based entirely on intuitively 3 appealing examples Not until two centuries later did von Neumann and Morgenstern 1947 prove that if the preferences of the decision maker satisfy cer tain assumptions they can be represented by the expected value of a real valued utility function defined on the set of consequences Despite the identical mathematical form of expected utility the theory of von Neumann and Morgenstern and Bernoulli s approach have however IFor comprehensive discussions of this paradox cf Menger 1934 Samuelson 1960 1977 Shapley 1977a Aumann 1977 Jorland 1987 and Zabell 1987 2Cramer 1728 p 212 on the other hand proposed that the utility of an amount of money is given by the square root of this amount

**Patrick Suppes: Scientific Philosopher** P. Humphreys, 1994-09-30 Patrick Suppes is a philosopher and scientist whose contributions range over probability and statistics mathematical and experimental psychology the foundations of physics education theory the philosophy of language measurement theory and the philosophy of science He has also been a pioneer in the area of computer assisted instruction In each of these areas Suppes has provided seminal ideas that in some cases led to shaping the

direction of research in the field. The papers contained in this collection were commissioned with the mandate of advancing research in their respective fields rather than retrospectively surveying the contributions that Suppes himself has made. The authors form an interesting mixture of researchers in both formal philosophy of science and science itself, all of whom have been inspired by his ideas. To maintain the spirit of constructive dialogue that characterizes Suppes's intellectual style, he has written individual responses to each article.

In Volume 1, *Probability and Probabilistic Causality*, nineteen distinguished philosophers and scientists focus their attention on probabilistic issues. In Part I, the contributors explore axiomatic representations of probability theory, including qualitative and interval-valued probabilities as well as traditional point-valued probabilities. Belief structures and the dynamics of belief are also treated in detail. In Part II, the rapidly growing field of probabilistic causation is assessed from both formal and empirical viewpoints. For probability theorists, statisticians, economists, philosophers of science, psychologists, and those interested in the foundations of mathematical social science. In Volume 2, *Philosophy of Physics: Theory, Structure, and Measurement Theory*, fifteen distinguished philosophers and scientists cover a wide variety of topics. Part III covers issues in quantum theory, geometry, classical mechanics, and computational physics. Part IV explores Suppes's well-known set-theoretic account of scientific theories, which has served him well throughout his career. Suppes's contributions to measurement theory have been widely used in mathematical psychology and elsewhere, and this material is the subject of Part V. For physicists, logicians, workers in mathematical social science, and philosophers of science. In Volume 3, *Philosophy of Language and Logic: Learning and Action Theory*, fourteen distinguished philosophers and scientists explore issues in the philosophy of language, logic, and philosophical psychology. Suppes's suggestions that quantum theory requires a rethinking of classical logic form a particularly sharp account of that controversial thesis, and Part VI deals with this issue together with topics in the philosophy of language and logic, including relational grammars and anaphora. Part VII deals with issues in psychology, action theory, and robotics, while Part VIII concludes with a general survey of Suppes's views in the philosophy of science. A comprehensive chronological and topical bibliography of Suppes's writings is included in this volume.

For philosophers of language, theoretical linguists, logicians, workers in mathematical social sciences, and philosophers of science.

*Handbook of Game Theory with Economic Applications*, R.J. Aumann, S. Hart, 1992. This is the second of three volumes surveying the state of the art in Game Theory and its applications to many and varied fields, in particular to economics. The chapters in the present volume are contributed by outstanding authorities and provide comprehensive coverage and precise statements of the main results in each area. The applications include empirical evidence. The following topics are covered: communication and correlated equilibria, coalitional games and coalition structures, utility and subjective probability, common knowledge, bargaining, zero-sum games, differential games, and applications of game theory to signalling, moral hazard, search, evolutionary biology, international relations, voting procedures, social choice, public economics, politics, and cost allocation.
