Multicriteria Optimization of Nondifferentiable Stochastic Biosystems James Carl Schäper, 1998 *Dynamics and Control of Multibody Systems* Perinkulam Sambamurthy Krishnaprasad, Juan C. Simo, 1989 The study of complex interconnected mechanical systems with rigid and flexible articulated components is of growing interest to both engineers and mathematicians Recent work in this area reveals a rich geometry underlying the mathematical models used in this context In particular Lie groups of symmetries reduction and Poisson structures play a significant role in explicating the qualitative properties of multibody systems In engineering applications it is important to exploit the special structures of mechanical systems For example certain mechanical problems involving control of interconnected rigid bodies can be formulated as Lie Poisson systems The dynamics and control of robotic aeronautic and space structures involve difficulties in modeling mathematical analysis and numerical implementation For example a new generation of spacecraft with large flexible components are presenting new challenges to the accurate modeling and prediction of the dynamic behavior of such structures Recent developments in Hamiltonian dynamics and coupling of systems with symmetries has shed new light on some of these issues while engineering questions have suggested new mathematical structures These kinds of considerations motivated the organization of the AMS IMS SIAM Joint Summer Research Conference on Control Theory and Multibody Systems held at Bowdoin College in August 1988 This volume contains the proceedings of that conference The papers presented here cover a range of topics all of which could be viewed as applications of geometrical methods to problems arising in dynamics and control The volume contains contributions from some of the top researchers and provides an excellent overview of the frontiers of research in this burgeoning area **SIAM Journal on Control and Optimization** Society for Industrial and Applied Mathematics, 1992 **Adaptive Numerical Solution of PDEs** Peter Deuflhard, Martin Weiser, 2012-08-31 This book deals with the general topic Numerical solution of partial differential equations PDEs with a focus on adaptivity of discretizations in space and time By and large introductory textbooks like Numerical Analysis in Modern Scientific Computing by Deuflhard and Hohmann should suffice as a prerequisite The emphasis lies on elliptic and parabolic systems Hyperbolic conservation laws are treated only on an elementary level excluding turbulence Numerical Analysis is clearly understood as part of Scientific Computing The focus is on the efficiency of algorithms i e speed reliability and robustness which directly leads to the concept of adaptivity in algorithms The theoretical derivation and analysis is kept as elementary as possible Nevertheless required somewhat more sophisticated mathematical theory is summarized in comprehensive form in an appendix Complex relations are explained by numerous figures and illustrating examples Non trivial problems from regenerative energy nanotechnology surgery and physiology are inserted The text will appeal to graduate students and researchers on the job in mathematics science and technology Conceptually it has been written as a textbook including exercises and a software list but at the same time it should be well suited for self study Mathematical
