Non-perturbative Quantum Field Theory: Mathematical Aspects And Applications Jurg Frohlich, 1992-04-29

Compiled to illustrate the recent history of Quantum Field Theory and its trends this collection of selected reprints by Jurg Frohlich a leading theoretician in the field is a comprehensive guide of the more mathematical aspects of the subject Results and methods of the past fifteen years are reviewed The analytical methods employed are non perturbative and for the larger part mathematically rigorous Most articles are review articles surveying certain important developments in quantum field theory and guiding the reader towards the original literature The volume begins with a comprehensive introduction by Jurg Frohlich The theory of phase transitions and continuous symmetry breaking is reviewed in the first section The second section discusses the non perturbative quantization of topological solitons The third section is devoted to the study of gauge fields A paper on the triviality of ϕ^4 theory in four and more dimensions is found in the fourth section while the fifth contains two articles on random geometry The sixth and final part addresses topics in low dimensional quantum field theory including braid statistics two dimensional conformal field theory and an application to condensed matter theory

Nonperturbative Quantum Field Theory and the Structure of Matter T. Borne, G. Lochak, H. Stumpf, 2005-12-19 This book which presents a new view of quantum field theory may serve as a research monograph and an alternative textbook examining topics which are not usually treated in conventional works Audience This volume will appeal to researchers concerned with the foundation of the theory of matter and forces including gravitation It will also be interesting to those working with quantum field theoretic methods in various disciplines such as particle physics nuclear physics condensed matter physics and relativity Jacket Nonperturbative Quantum Field Theory G. Hooft, A. Jaffe, G. Mack, P.K. Mitter, R. Stora, 2012-12-06 During the past 15 years quantum field theory and classical statistical mechanics have merged into a single field and the need for nonperturbative methods for the description of critical phenomena in statistical mechanics as well as for problems in elementary particle physics are generally acknowledged Such methods formed the central theme of the 1987 Cargèse Advanced Study Institute on Nonperturbative Quantum Field Theory The use of conformal symmetry has been of central interest in recent years and was a main subject at the ASI Conformal invariant quantum field theory describes statistical mechanical systems exactly at a critical point and can be analysed to a remarkable extent by group theoretical methods Very strong results have been obtained for 2 dimensional systems Conformal field theory is also the basis of string theory which offers some hope of providing a unified theory of all interactions between elementary particles Accordingly a number of lectures and seminars were presented on these two topics After systematic introductory lectures conformal field theory on Riemann surfaces orbifolds sigma models and application of loop group theory and Grassmannians were discussed and some ideas on modular geometry were presented Other lectures combined traditional techniques of constructive quantum field theory with new methods such as the use of index theorems and infinite dimensional Kac Moody symmetry groups The

problems encountered in a quantum mechanical description of black holes were discussed in detail *Non-perturbative Methods in 2 Dimensional Quantum Field Theory* Elcio Abdalla, M. Cristina B. Abdalla, Klaus Dieter Rothe, 1991 This book is a survey of methods used in the study of two dimensional models in quantum field theory as well as applications of these theories in physics It covers the subject since the first model studied in the fifties up to modern developments in string theories and includes exact solutions non perturbative methods of study and nonlinear sigma models
