Nonstandard Methods in Fixed Point Theory Asuman Geuven Aksoy, Mohamed A. Khamsi, *Nonstandard Methods in Fixed Point Theory* Asuman G Aksoy, Mohamed A Khamsi, 1990-08-06 **Nonstandard Methods in Fixed Point Theory** Asuman G. Aksoy, Mohamed A. Khamsi, 2012-12-06 A unified account of the major new developments inspired by Maurey's application of Banach space ultraproducts to the fixed point theory for non expansive mappings is given in this text. The first third of the book is devoted to laying a careful foundation for the actual fixed point theoretic results which follow. Set theoretic and Banach space ultraproducts constructions are studied in detail in the second part of the book while the remainder of the book gives an introduction to the classical fixed point theory in addition to a discussion of normal structure. This is the first book which studies classical fixed point theory for non expansive maps in the view of non standard methods.

Fixed Point Theory Andrzej Granas, James Dugundji, 2013-03-09 The aim of this monograph is to give a unified account of the classical topics in fixed point theory that lie on the border line of topology and non linear functional analysis emphasizing developments related to the Leray Schauder theory. Using for the most part geometric methods our study centers around formulating those general principles of the theory that provide the foundation for many of the modern results in diverse areas of mathematics. The main text is self contained for readers with a modest knowledge of topology and functional analysis the necessary background material is collected in an appendix or developed as needed. Only the last chapter presupposes some familiarity with more advanced parts of algebraic topology. The Miscellaneous Results and Examples given in the form of exercises form an integral part of the book and describe further applications and extensions of the theory. Most of these additional results can be established by the methods developed in the book and no proof in the main text relies on any of them. More demanding problems are marked by an asterisk. The Notes and Comments at the end of paragraphs contain references to the literature and give some further information about the results in the text. **Fixed Point Theory and Graph Theory**

Monther Alfuraidan, Qamrul Ansari, 2016-06-20 *Fixed Point Theory and Graph Theory* provides an intersection between the theories of fixed point theorems that give the conditions under which maps single or multivalued have solutions and graph theory which uses mathematical structures to illustrate the relationship between ordered pairs of objects in terms of their vertices and directed edges. This edited reference work is perhaps the first to provide a link between the two theories describing not only their foundational aspects but also the most recent advances and the fascinating intersection of the domains. The authors provide solution methods for fixed points in different settings with two chapters devoted to the solutions method for critically important non linear problems in engineering namely variational inequalities fixed point split feasibility and hierarchical variational inequality problems. The last two chapters are devoted to integrating fixed point theory in spaces with the graph and the use of retractions in the fixed point theory for ordered sets. Introduces both metric fixed point and graph theory in terms of their disparate foundations and common application environments. Provides a unique

integration of otherwise disparate domains that aids both students seeking to understand either area and researchers interested in establishing an integrated research approach Emphasizes solution methods for fixed points in non linear problems such as variational inequalities split feasibility and hierarchical variational inequality problems that is particularly appropriate for engineering and core science applications

Nonstandard Analysis for the Working Mathematician Peter A. Loeb,Manfred P. H.

Wolff,2015-08-26 Starting with a simple formulation accessible to all mathematicians this second edition is designed to provide a thorough introduction to nonstandard analysis Nonstandard analysis is now a well developed powerful instrument for solving open problems in almost all disciplines of mathematics it is often used as a secret weapon by those who know the technique This book illuminates the subject with some of the most striking applications in analysis topology functional analysis probability and stochastic analysis as well as applications in economics and combinatorial number theory The first chapter is designed to facilitate the beginner in learning this technique by starting with calculus and basic real analysis The second chapter provides the reader with the most important tools of nonstandard analysis the transfer principle Keisler's internal definition principle the spill over principle and saturation The remaining chapters of the book study different fields for applications each begins with a gentle introduction before then exploring solutions to open problems All chapters within this second edition have been reworked and updated with several completely new chapters on compactifications and number theory Nonstandard Analysis for the Working Mathematician will be accessible to both experts and non experts and will ultimately provide many new and helpful insights into the enterprise of mathematics

Geometric Properties of Banach

Spaces and Nonlinear Iterations Charles Chidume, 2008-12-21 The contents of this monograph fall within the general area of nonlinear functional analysis and applications. We focus on an important topic within this area geometric properties of Banach spaces and nonlinear iterations a topic of intensive research efforts especially within the past 30 years or so. In this theory some geometric properties of Banach spaces play a crucial role. In the first part of the monograph we expose these geometric properties most of which are well known. As is well known among all infinite dimensional Banach spaces Hilbert spaces have the nicest geometric properties. The availability of the inner product the fact that the proximity map or nearest point map of a real Hilbert space H onto a closed convex subset K of H is Lipschitzian with constant 1 and the following two identities $2 \leq 2 \times y \leq 2 \times y \leq 2 \times 2 \times 2 \times 1 \leq y \leq 1 \leq y$ which hold for all $y \in H$ are some of the geometric properties that characterize inner product spaces and also make certain problems posed in Hilbert spaces more manageable than those in general Banach spaces. However as has been rightly observed by M Hazewinkel many and probably most mathematical objects and models do not naturally live in Hilbert spaces. Consequently to extend some of the Hilbert space techniques to more general Banach spaces analogues of the identities and have to be developed.

Theory and Applications of Nonlinear Operators of

Accretive and Monotone Type Athanass Kartsatos, 1996-03-14 This work is based upon a Special Session on the Theory and Applications of Nonlinear Operators of Accretive and Monotone Type held during the recent meeting of the American Mathematical Society in San Francisco. It examines current developments in nonlinear analysis emphasizing accretive and monotone operator theory. The book presents a major survey research article on partial functional differential equations with delay and an important survey research article on approximation solvability.

Applied Mathematics in Tunisia

Aref Jeribi, Mohamed Ali Hammami, Afif Masmoudi, 2015-10-05 This contributed volume presents some recent theoretical advances in mathematics and its applications in various areas of science and technology. Written by internationally recognized scientists and researchers the chapters in this book are based on talks given at the International Conference on Advances in Applied Mathematics ICAAM which took place December 16-19 2013 in Hammamet Tunisia. Topics discussed at the conference included spectral theory, operator theory, optimization, numerical analysis, ordinary and partial differential equations, dynamical systems, control theory, probability and statistics. These proceedings aim to foster and develop further growth in all areas of applied mathematics.
