Mathematical Models For Sustainable Development:

Mathematical Modelling for Sustainable Development Marion Hersh,2006-01-02 Many people are convinced that Sustainable Development and Mathematics are completely unrelated Sustainable Development in its role of a value laden imperative for polluting and over consuming societies seems to be totally unconnected to mathematical reasoning and ignorant of the values behind its symbols Still they are not only connected they need each other Mathematics needs Sustainable Development When science was gradually reinvented in European medieval societies it was legitimised as contributing to the disclosure of God's divine creation The conflicts that emerged became well known as a result of the clash between Galileo and the Church Science found a new legitimacy through recognition that it was a powerful force against superstition In the Enlightenment the argument was pushed forward by attributing Progress to the advancement of science science could produce a better world by promoting rationality In our modern society science has become intimately linked to technology Science for its own sake unfortunately rarely has positive outcomes in terms of research grant applications Meanwhile science and technology and the progress they are supposed to produce meet with wide scale scepticism We all know of the current global problems climate change resource depletion a thinning ozone layer space debris declining biodiversity malnutrition dying ecosystems global inequity and the risk of unprecedented nuclear wars Science has to engage with these problems or lose its legitimacy *Mathematical Modelling for Sustainable Development* Marion Hersh,2009-09-02 This reference offers both a basic introduction and advanced technical details of available mathematical and computing methods for modeling sustainable development closing an existing gap in this field as well as illustrating their use through case studies and examples The methods and case studies presented here are targeted at sustainable development although they have a wide range of other applications including economics medicine and control systems

Sustainable Management of Natural Resources Michel De Lara, Luc Doyen,2008-08-07 Nowadays environmental issues including air and water pollution climate change overexploitation of marine ecosystems exhaustion of fossil resources conservation of biodiversity are receiving major attention from the public stakeholders and scholars from the local to the planetary scales It is now clearly recognized that human activities yield major ecological and environmental stresses with irreversible loss of species destruction of habitat or catastrophic catastrophes as the most dramatic examples of these effects In fact these anthropogenic activities impact not only the states and dynamics of natural resources and ecosystems but also alter human health well-being welfare and economic wealth since these resources are support features for human life The numerous outputs furnished by nature include direct goods such as food drugs energy along with indirect services such as the carbon cycle the water cycle and pollination to cite but a few Hence the various ecological changes our world is undergoing draw into question our ability to sustain economic production wealth and the evolution of technology by taking natural systems into account The concept of sustainable development covers such concerns although no universal consensus exists about this

notion Sustainable development emphasizes the need to organize and control the dynamics and the complex interactions between man production activities and natural resources in order to promote their coexistence and their common evolution. It points out the importance of studying the interfaces between society and nature and especially the coupling between economics and ecology. It induces interdisciplinary scientific research for the assessment, the conservation and the management of natural resources.

Biology and Sustainable Development Goals

A. A. Elsadany, Waleed Adel, Yassine Sabbar, 2025-05-30. This edited book provides a comprehensive framework for the integration of mathematical methodologies into biological research emphasizing applications that directly address topics related to SDG 3 Good Health and Well Being and SDG 6 Clean Water and Sanitation. From the mathematical modeling of infectious diseases to the design of smart agricultural systems each chapter presents key global issues where mathematical analysis is a powerful tool for driving progress. This work emphasizes the importance of mathematical models in predicting outcomes, optimizing interventions and understanding the dynamics of complex biological systems. The central theme of the book is the application of mathematical methods ranging from deterministic models, stochastic processes, fractional calculus and machine learning algorithms to biological problems framed in the context of sustainability. Each chapter is crafted to showcase how mathematical models not only enhance our understanding of biological phenomena but also play a pivotal role in developing solutions to global issues such as pandemics, environmental degradation and resource management.

Dynamic

Management of Sustainable Development Zigurds Krishans, Anna Mutule, Yuri Merkuryev, Irina Oleinikova, 2011-03-23. Dynamic management of systems development is a precondition for the realization of sustainable system development. This approach allows for the usage of systems theory methods that take into consideration the interaction of decisions made over time and space. A characteristic feature of this kind of method is that the process of sophisticated object development over time is examined for optimal decision selection. This requires the application of modelling methods that represent properties of the developing objects, high speed calculation methods for the estimation of technical and economic characteristics as well as effective optimization methods. Dynamic Management of Sustainable Development presents a concise summary of the authors research in the area of dynamic methods analysis of technical systems development. Along with systematic illustration of mathematical methods considerable attention is drawn to practical realization and applications. Dynamic Management of Sustainable Development will be helpful for scientists involved in the mathematical modelling of large technical systems development and for engineers working in the area of large technical systems planning.
