Mathematics For Economics:

Mathematics for Economics, third edition Michael Hoy, John Livernois, Chris McKenna, Ray Rees, Thanasis Stengos, 2011-03-11 A new edition of a comprehensive undergraduate mathematics text for economics students. This text offers a comprehensive presentation of the mathematics required to tackle problems in economic analyses. To give a better understanding of the mathematical concepts the text follows the logic of the development of mathematics rather than that of an economics course. The only prerequisite is high school algebra but the book goes on to cover all the mathematics needed for undergraduate economics. It is also a useful reference for graduate students. After a review of the fundamentals of sets, numbers and functions the book covers limits and continuity, the calculus of functions of one variable, linear algebra, multivariate calculus and dynamics. To develop the student's problem solving skills the book works through a large number of examples and economic applications. This streamlined third edition offers an array of new and updated examples. Additionally, lengthier proofs and examples are provided on the book's website. The book and the web material are cross-referenced in the text. A student solutions manual is available and instructors can access online instructor's material that includes solutions and PowerPoint slides. By following the worked examples and tackling the practice problems students will discover how to use and apply each of these techniques. Now in its second edition the text features expanded summaries of economic analysis, new sections on matrix algebra and linear programming and additional demonstrations of economics applications. Demonstrates mathematical techniques while explaining their economic and business applications. Engages the reader with numerous worked examples and practice problems. Features new sections on matrix algebra and linear programming.
