Keller, 2012-11-29 Theoretical and experimental work on solids with low dimensional cooperative phenomena has been rather explosively expanded in the last few years and it seems to be quite fashionable to contribute to this field especially to the problem of one dimensional metals On the whole one could divide the huge amount of recent investigations into two parts although there is much overlap between these regimes namely investigations on magnetic exchange interactions constrained to mainly one or two dimensions and secondly work done on 1d metallic solids or linear chain compounds with 1d delocalized electrons There is of course overlap from one extreme case to the other with these solids and in some rare cases both phenomena are studied on one and the same crystal In fact however most of the scientific groups in this area could be associated roughly with one of these categories and in addition a separation between theoreticians and experimentalists in each of these groups leads to a further splitting of interests although many theories about these solids have been tested by experimentalists Nevertheless more cooperation and understanding between scientists working on low dimensional cooperative phenomena should appreciably stimulate further development With a better interdisciplinary understanding new ideas could possibly help chemists in synthesizing tailor cut solids This would in return give experimentalists new phenomena to examine and finally would stimulate new theoretical work **Low-dimensional Cooperative Phenomena**
