**Low Dimensional Topology and Number Theory** Masanori Morishita, Hiroaki Nakamura, Jun Ueki, 2025-03-02 This book is the result of research initiatives formed during the workshop Low Dimensional Topology and Number Theory XIII at Kyushu University in 2022 It is also dedicated to the memory of Professor Toshie Takata who has been a main figure of the session chairs for the series of annual workshops since 2009 The activity was aimed at understanding and deepening recent developments of lively and fruitful interactions between low dimensional topology and number theory over the past decades In this volume of proceedings the reader will find research papers as well as survey articles including open problems at the interface between classical and quantum topology and algebraic and analytic number theory written by leading experts and active researchers in the respective fields Topics include among others the strong slope conjecture Kashiwara Vergne Lie algebra braids and fibered double branched covers of 3 manifolds Temperley Lieb Jones category and conformal blocks WRT invariants and false theta functions the colored Jones polynomial of the figure eight knot potential functions and A polynomials l adic Galois polylogarithms Dijkgraaf Witten invariants in Bloch groups analogies between knots and primes in arithmetic topology normalized Jones polynomials for rational links Iwasawa main conjecture Weber's class number problem The book provides a valuable resource for researchers and graduate students interested in topics related to both low dimensional topology and number theory

**Ramsey Theory** Xiaodong Xu, Meilian Liang, Haipeng Luo, 2018-08-06 Key problems and conjectures have played an important role in promoting the development of Ramsey theory a field where great progress has been made during the past two decades with some old problems solved and many new problems proposed The present book will be helpful to readers who wish to learn about interesting problems in Ramsey theory to see how they are interconnected and then to study them in depth This book is the first problem book of such scope in Ramsey theory Many unsolved problems conjectures and related partial results in Ramsey theory are presented in areas such as extremal graph theory additive number theory discrete geometry functional analysis algorithm design and in other areas Most presented problems are easy to understand but they may be difficult to solve They can be appreciated on many levels and by a wide readership ranging from undergraduate students majoring in mathematics to research mathematicians This collection is an essential reference for mathematicians working in combinatorics and number theory as well as for computer scientists studying algorithms Contents Some definitions and notations Ramsey theory Bi color diagonal classical Ramsey numbers Paley graphs and lower bounds for  $R(k, k)$  Bi color off diagonal classical Ramsey numbers Multicolor classical Ramsey numbers

*Invariants And Pictures: Low-dimensional Topology And Combinatorial Group Theory* Vassily Olegovich Manturov, Denis Fedoseev, Seongjeong Kim, Igor Nikonov, 2020-04-22 This book contains an in depth overview of the current state of the recently emerged and rapidly growing theory of  $G_n k$  groups picture valued invariants and braids for arbitrary manifolds Equivalence relations arising in low dimensional topology and combinatorial group theory inevitably lead to the study of invariants and good invariants should be strong and apparent An interesting case of such invariants is picture valued invariants whose values are not algebraic objects but geometrical constructions like graphs or polyhedra In 2015 V O Manturov defined a two parametric family of groups  $G_n k$  and formulated the following principle if dynamical systems describing a motion of  $n$  particles possess a nice codimension 1 property governed by exactly  $k$  particles then these dynamical systems possess topological invariants valued in  $G_n k$  The book is devoted to various realisations and generalisations of this principle in the broad sense The groups  $G_n k$  have many epimorphisms onto free products of cyclic groups hence invariants constructed from them are powerful enough and easy to compare However this construction does not work when we try to deal with points on a 2 surface since there may be infinitely many geodesics passing through two points That leads to the notion of another family of groups  $n k$  which give rise to braids on arbitrary manifolds yielding invariants of arbitrary manifolds

Number Theory Sinnou David, 1995 This is the fourteenth annual volume arising from the *Seminaire de Theorie des Nombres de Paris* As with previous volumes the whole spectrum of number theory is discussed with many contributions from some of the world's leading figures The very latest research developments are covered and much of the work presented here will not be found elsewhere Also included are surveys that will serve to guide the reader through the extensive published literature This will be a necessary addition to the libraries of all workers in number theory
