Many stochastic systems, such as switching systems, Markovian jumping systems, jumping neural networks, T-S fuzzy jumping systems and network control systems, have arisen naturally in the mathematical modeling of phenomena spanning disciplines in the social sciences, natural sciences, and engineering. Much attention has been given to modeling, control optimization, robust filtering, signal processing, and real applications of such stochastic dynamical systems in the literature in recent years. This special issue provides a forum for researchers and practitioners to publish quality research work on modeling, optimization approaches, and their applications in the context of theory analysis and engineering developments. The accepted papers in this special issue include stochastic stability, stabilization and control optimization, stochastic optimization, particle swarm optimization, modeling and identification methods, signal processing, robust filtering, sliding mode control, multiagent systems, nonlinear systems, time-delayed systems, neural networks, T-S fuzzy systems, simulated annealing, and fault diagnosis methods.

In this special issue, we have accepted thirty-nine papers, of which six consider the stability and stabilization problems of stochastic systems. Twelve papers cover the problems of the controller design and relevant optimization algorithms. There are three articles that discussed the signal processing methods. One paper focuses on fault diagnosis and fault tolerant control for non-Gaussian singular time-delayed stochastic

systems, and three consider the state estimation and filtering problems of discrete-time stochastic systems. Finally, fourteen papers study the stochastic systems modeling and identification methods.

Over the past few decades, the stochastic stability, stabilization, and control optimization problems have long been the mainstreams of research topics. "Exponential synchronization of stochastic complex dynamical networks with impulsive perturbations and Markovian switching" by W. Zhou et al. studies the exponential synchronization for a class of Markovian switching networks with impulsive perturbations and "Almost sure asymptotical adaptive synchronization for neutral-type neural networks with stochastic perturbation and Markovian switching" by W. Zhou et al. concerns the almost sure asymptotical adaptive synchronization for a class of nonlinear Markovian switching networks. "Stabilization of discrete-time Markovian jump systems via controller with partially mode-dependent characterization" by C. Zhai et al. developed a kind of stabilizing controller in terms of being partially mode-dependent for discrete-time Markovian jump systems. "Fuzzy stabilization for nonlinear discrete ship steering stochastic systems subject to state variance and passivity constraint" by W.-J. Chang et al. is concerned with a fuzzy stabilization methodology for nonlinear discrete-time stochastic systems, subject to state variance constraint and passivity constraint. "Simple adaptive asymptotic tracking scheme for parametric strict-feedback nonlinear systems with

**Stochastic Systems** Masanao Aoki, 2008      Optimization of stochastic systems Masanao Aoki, 1967      **Optimization of stochastic systems** Jose Luis Farah, 1977      Optimization of Stochastic Systems Masanao Aoki, 1967      Optimization of stochastic systems Masanao Aoki, 1967      *Optimization of Stochastic Systems* Masanao Aoki, 1989 From the Preface The first edition of this book was written mainly for audiences with physical science and engineering backgrounds Nevertheless it reached some readers with economic and management science training Analytical training of graduate students in economics and management sciences had progressed much in the last 20 years and many new research results and optimization algorithms have also become available My own interest in the meantime has shifted to the analysis of dynamics and optimization problems of economic and management science origin With these developments and changes I decided to rewrite much of the first edition to make it more accessible to graduate students and professionals in social sciences I have also incorporated some new analytic tools that I deem useful in analyzing the dynamic and stochastic problems which confront these readers I hope that my efforts successfully bring intertemporal optimization problems closer to economics professionals New topics introduced into this second edition appear mostly in Chapters 2 4 5 6 and 8 Martingales and martingale differences are introduced early in Chapter 2 Some limit theorems and asymptotic properties of linear state space models driven by martingale differences are presented Because many excellent books are available on martingales and their limit theorems derivations and proofs are mostly sketchy and readers are referred to these sources The results in Chapter 2 are applied in Chapters 5 6 and 8 among other places The notion of dynamic aggregation and its relation to cointegration and error correction models are developed in Chapter 4 Some recursive parameter estimation schemes and their statistical properties are included in Chapters 5 and 6 Here again books devoted entirely to these topics are available in the literature and much had to be omitted to keep the second edition to a manageable size In an appendix to Chapter 7 a potentially very powerful tool in proving convergence of adaptive schemes is outlined Rational expectations models and their solution methods are developed in Chapter 8 because of their wide spread interest to economists A very important class of problems in sequential decision problems revolves around questions of approximating nonlinear dynamics or more generally complex situations with a sequence of less complex ones Chapter 9 does not begin to do justice to this class of problems but is included as being suggestive of works to be done When I first started contemplating the revision of the first edition I benefited from a list of excellent suggestions from Rick van der Ploeg though I did not necessarily incorporate all of his suggestions Conversations with Thomas Sargent and Victor Solo were useful in organizing the material into the form of the second edition I also benefited from discussions with Hashem Pesaran and correspondences with L Broze in finalizing Chapter 8 Some material in this book was used as lecture notes in a graduate course in the Department of Economics

University of California Los Angeles the winter quarter of 1987 I thank the participants in the course for many useful comments Key Features This major revision of the First Edition addresses optimization problems stated in stochastic difference equations which often contain uncertain or randomly varying parameters Presents a set of concepts and techniques useful in analyzing or controlling stochastic dynamic processes with possible incompletely specified characteristics It discusses basic system properties such as Stability and observability Dynamic programming formulations of optimal and adaptive control problems Parameter estimation schemes and their convergence behavior Solution methods for rational expectations models using martingale differences
