Systematic Materials Analysis Part 2 J.H. Richardson, 2012-12-02 Systematic Materials Analysis Volume II presents a broad range of instrumental methods and approaches that will yield the desired information about a given material. This book serves as a guide for the purchase of new instrumentation. Organized into nine chapters, this volume starts with an overview of the analytical methods on the bases of specimen limitations and information desired by using flow charts encompassing the various instruments. This book then proceeds with a discussion of the specific instruments that outline the theories of operation. Other chapters consider the capability of the methods for quantitative and qualitative measurements of structure, texture and chemical composition. This text discusses as well the selectivity and sensitivity of each method. The final chapter deals with X-ray photoelectron spectroscopy and provides a listing of known manufacturers of commercial ESCA (Electron Spectroscopy for Chemical Analysis) instrumentation. Materials analysts, laboratory administrator, biological scientists, engineers and researchers will find this book extremely useful.

The Chemist's Companion Arnold J. Gordon, Richard A. Ford, 1973-01-19 Here in one source is a wide variety of practical everyday information often required by chemists but seldom found together if at all in the standard handbooks, data collections, manuals and other usual sources. Discussing physical, chemical and mechanical properties of substances and systems, the authors answer such questions as: How do I test for and destroy peroxides in different solvents and what is the best way to purify such solvents? What are the structure, physical properties and recent references to the use of common name solvents and solvent aids such as the Skellysolves, Cellosolves, Crownanes and Glymes? What is the utility of a particular molecular sieve or permeation gel or epoxy cement or liquid crystal and where do I buy them and find references to their application? The book is divided into nine chapters and covers properties of atoms and molecules, spectroscopy, photochemistry, chromatography, kinetics and thermodynamics, various experimental techniques and mathematical and numerical information, including the definitions, values and usage rules of the newly adopted International System of Units (SI Units). A section on statistical treatment of data which provides an actual least squares computer program is also included. In the spectroscopy chapter, very extensive and up-to-date collections of spectral correlation data are presented for IR, UV, VIS, optical rotation, NMR and mass spectra, along with data on ESR and NQR spectroscopy. Also included is a variety of hard to classify but frequently sought information such as names and addresses of microanalysis companies and chemistry publishers, descriptions and commercial sources of atomic and molecular models and safety data for hazardous chemicals. More than 500 key references are also included, most of which are recent. There are important hints and definitions associated with the art as well as the state of the art for the appropriate subjects. Also found throughout the book are about 250 suppliers and directions for obtaining special booklets or other material. Containing a wealth of useful
