Robillard,1983 Teaches the Mechanics of Robot Hands Arms Legs Tactile Sensing Motion Attitude Sensing Vision Systems   *Microprocessors in Robotic and Manufacturing Systems* S.G. Tzafestas,1991-10-31 Microprocessors play a dominant role in computer technology and have contributed uniquely in the development of many new concepts and design techniques for modem industrial systems This contribution is excessively high in the area of robotic and manufacturing systems However it is the editor s feeling that a reference book describing this contribution in a cohesive way and covering the major hardware and software issues is lacking The purpose of this book is exactly to fill in this gap through the collection and presentation of the experience of a number of experts and professionals working in different academic and industrial environments The book is divided in three parts Part 1 involves the first four chapters and deals with the utilization of microprocessors and digital signal processors DSPs for the computation of robot dynamics The emphasis here is on parallel computation with particular problems attacked being task granularity task allocation scheduling and communication issues Chapter I by Zheng and Hemami is concerned with the real time multiprocessor computation of torques in robot control systems via the Newton Euler equations This reduces substantially the height of the evaluation tree which leads to more effective parallel processing Chapter 2 by D Hollander examines thoroughly the automatic scheduling of the Newton Euler inverse dynamic equations The automatic program decomposition and scheduling techniques developed are embedded in a tool used to generate multiprocessor schedules from a high level language program   *Microprocessor-Based Control Systems* N.K. Sinha,1986-06-30 Recent advances in LSI technology and the consequent availability of inexpensive but powerful microprocessors have already affected the process control industry in a significant manner Microprocessors are being increasingly utilized for improving the performance of control systems and making them more sophisticated as well as reliable Many concepts of adaptive and learning control theory which were considered impractical only 20 years ago are now being implemented With these developments there has been a steady growth in hardware and software tools to support the microprocessor in its complex tasks With the current trend of using several microprocessors for performing the complex tasks in a modern control system a great deal of emphasis is being given to the topic of the transfer and sharing of information between them Thus the subject of local area networking in the industrial environment has become assumed great importance The object of this book is to present both hardware and software concepts that are important in the development of microprocessor based control systems An attempt has been made to obtain a balance between theory and practice with emphasis on practical applications It should be useful for both practicing engineers and students who are interested in learning the practical details of the implementation of microprocessor based control systems As some of the related material has been published in the earlier volumes of this series duplication has been avoided as far as possible   **A Microprocessor-based Control System with Robotics Applications**
