*Motile Muscle and Cell Models* N. I. Arronet, 1975      *Motile Muscle and Cell Models* N. I. Arronet, 1975      Motile Muscle and Cell Models Nikolaï Iosifovich Arronet, 1973      Motile Muscle and Cell Models N. I. Arronet, 2014-09-12 One of the early ways by which man learns about the surrounding world is by taking to pieces an object which attracts his attention. This method which is widely used by children is resorted to once again by the adult who wishes to study natural phenomena. The method of dismantling a complete object into its parts so that it can be studied has found its widest and most successful application in biology and in particular in the study of living cells. The cytologist studying a cell will usually have to examine its fragments which may be dead or semiliving. In sections of killed cells with the aid of the light or electron microscope he tries to obtain some idea of the structure of the living cell. As he investigates fractions isolated from a tissue homogenate or substances isolated from individual cells he tries to discover the biochemical functions of the cell organelles and their components. In every case the study of degradation products of the cell depending on the degree of degradation these may be isolated nuclei, nucleoli, nucleolar ribosomes, ribosomal proteins and RNA, mitochondria, fragments of mitochondrial membranes and so on makes its own contribution to knowledge and the information obtained on different objects is mutually complementary. Among all the cell fragments obtained experimentally which can make a great contribution to our knowledge of cell structure an important place is occupied by contractile cell models.      **The Motility of Muscle and Cells** Hans Hermann Weber, 1958

*Muscle Contraction and Cell Motility* H. Sugi, 2012-12-06 This volume intends to provide a comprehensive overview on the mechanisms of muscle contraction and non-muscle cell motility at the molecular and cellular level not only for investigators in these fields but also for general readers interested in these topics. A most attractive feature of various living organisms in the animal and plant kingdoms is their ability to move. In spite of a great diversity in the structure and function of various motile systems it has frequently been assumed since the nineteenth century that all kinds of motility are essentially the same. Based on this assumption some investigators in the nineteenth century thought that the mechanisms of motility could better be studied on primitive non-muscle motile systems such as amoeboid movement rather than on highly specialized muscle cells. Contrary to their expectation however the basic mechanisms of motility have been revealed solely by investigations on vertebrate skeletal muscles since a monumental discovery of Szent-Györgyi and his coworkers in the early 1940s that muscle contraction results from the interaction between two different contractile proteins, actin and myosin coupled with ATP hydrolysis.      Cell and Muscle Motility Robert M. Dowben, Jerry W. Shay, 1983-05

**Molecular Aspects of the Stress Response: Chaperones, Membranes and Networks** Peter Csermely, László Vigh, 2007-08-09 We are extremely happy to present the reader this book containing a summary of a well-known research field, the phenomenon of cellular stress defense from two new angles, networks and membranes. The volume starts with an introduction to the concept of molecular chaperones in their original sense. R. John Ellis, the founder of the chaperone concept.

describes chaperones as mediators of correct assembly and or misassembly of other macromolecular complexes This sets the tone of the book where later chapters give detailed examples of the richness of chaperone action by hundreds of other proteins and membrane structures The reader will learn the role of chaperone classes such as Hsp27 or Hsp90 the action of highly organized chaperone networks in various cellular compartments such as the ER or mitochondrial ER networks as well as the molecular details of the signaling mechanisms leading to chaperone induction during stress Various special stress defense mechanisms against oxidative stress or dryness will also be covered Membranes comprise a surprising mixture of stability and dynamics in the cell Their role in the regulation of the stress response has been accepted only slowly in the field Two chapters summarize this important aspect of the stress response showing the importance of membrane hyperstructures lipid species composition protein membrane interactions and cold adaptation

*Comparative Biochemistry V2* Marcel Florkin, 2012-12-02 *Comparative Biochemistry A Comprehensive Treatise Volume II Free Energy and Biological Function* focuses on methodologies processes and mechanisms involved in the biological transformations of energy Composed of contributions of various authors the book first discusses free energy and the biosynthesis of phosphates The thermodynamics of phosphoryl and phosphate transfer reactions enzymatic synthesis of phosphates and phosphoryl transfer sequences in metabolism are considered The selection also looks at the utilization of free energy in the biosynthesis of saccharides proteins and peptides ammonia metabolism and biosynthesis of urea The book also describes muscular contraction The structure of myofibril protein components of myofibril localization of myofibrillar components contraction of adenosine triphosphate and adenosine triphosphatases of muscles are discussed Other mechanisms that produce movements are also noted The text ends with discussions on experiments on active transport balance of electrolytes and water mechanisms of osmoregulation bioluminescence and nerve conduction and electrical discharge The book is a good source of data for readers interested in studying free energy

*New Advances in Gastrointestinal Motility Research* L. K. Cheng, A. J. Pullan, G. Farrugia, 2013-06-01 Research into gastrointestinal motility has received renewed interest in part due to recent advances in the techniques for measuring the structure and function of gastrointestinal cells tissue and organs The integration of this wealth of data into biophysically based computation models can aid in interpretation of experimental and clinical measurements and the refinement of measurement techniques The contents of this book span multiple scales from cell tissue organ to whole body and is divided into four broad sections covering i gastrointestinal cellular activity and tissue structure ii techniques for measuring analyzing and visualizing high resolution extra cellular recordings iii methods for sensing gastroelectrical activity using non invasive bio electro magnetic fields and for modulating the underlying gastric electrical activity and finally iv methods for assessing manometric and videographic motility patterns and the application of these data for predicting the flow and mixing behavior of luminal contents by using computational fluid dynamic techniques This book aims to provide both an overview of historical and existing research techniques as well as to highlight future directions and
