For some time there has been a need for a semiconductor device book that carries diode and transistor theory beyond an introductory level and yet has space to touch on a wider range of semiconductor device principles and applica tions Such topics are covered in specialized monographs numbering many hun dreds but the voluminous nature of this literature limits access for students This book is the outcome of attempts to develop a broad course on devices and integrated electronics for university students at about senior year level The edu cational prerequisites are an introductory course in semiconductor junction and transistor concepts and a course on analog and digital circuits that has intro duced the concepts of rectification amplification oscillators modulation and logic and SWitching circuits The book should also be of value to professional engineers and physicists because of both the information included and the de tailed guide to the literature given by the references The aim has been to bring some measure of order into the subject area examined and to provide a basic structure from which teachers may develop themes that are of most interest to students and themselves

Semiconductor devices and integrated circuits are reviewed and fundamental factors that control power levels frequency speed size and cost are discussed The text also briefly mentions how devices are used and presents circuits and comments on representative applications Thus the book seeks a balance be tween the extremes of device physics and circuit design

P. Yip, 2012-12-06 An elective course in the final year BEng programme in electronic engineering in the City Polytechnic of Hong Kong was generated in response to the growing need of local industry for graduate engineers capable of designing circuits and performing measurements at high frequencies up to a few gigahertz. This book has grown out from the lecture and tutorial materials written specifically for this course. This course should, in the opinion of the author, best be conducted if students can take a final year design project in the same area. Examples of projects in areas related to the subject matter of this book which have been completed successfully in the last two years that the course has been run include low noise amplifiers, dielectric resonator loaded oscillators and down converters in the 12 GHz as well as the 1 GHz bands, mixers, varactor tuned and non varactor tuned VCOs, low noise and power amplifiers and filters and duplexers in the 1 GHz, 800 MHz and 500 MHz bands. The book is intended for use in a course of forty lecture hours plus twenty tutorial hours and the prerequisite expected of the readers is a general knowledge of analogue electronic circuits and basic field theory. Readers with no prior knowledge in high frequency circuits are recommended to read the book in the order that it is arranged.
