**Mycotoxin Exposure and Related Diseases** Susana Viegas, Ricardo Assunção, 2020-05-12 Mycotoxins are considered the most frequently occurring natural contaminants in human and animal diets Considering their potential toxic and carcinogenic effects mycotoxin exposure assessment has particular importance in the context of health risk assessment The magnitude of a given exposure allows the derivation of the associated risk and the potential for the establishment of a disease Although food ingestion is considered a major route of human exposure to mycotoxins other contexts may also result in exposure such as specific

occupational environments where exposure to organic dust also occurs due to the handling of organic materials Animals could be exposed to mycotoxins through consumption of contaminated feed subsequently entering in the food chain and thus constituting a source of exposure to humans Human biomonitoring is considered a new frontier for the establishment of the human internal exposure to mycotoxins Although several studies have summarized the potential outcomes associated with mycotoxin exposure major gaps in data remain in recognizing the mycotoxins that are the cause of diseases This book contributes provides research that supports the anticipation of potential consequences of the exposure of humans and animals to mycotoxins future risk assessments and the establishment of preventive measures

is associated with nephropathy of people in the Balkan region where exposure may be endemic. The mechanisms of which OA induces renal tumors are not known but many toxic effects have been described including suppression of natural killer cells inhibition of specific enzymes and induction of lipid peroxidation adverse effects that are dealt with in detail in this volume. Other contributions deal with the roles of genetics and drug metabolism in the nephrotic and carcinogenic effects. The volume concludes with a section on risk assessment of OA based on food residues as related to human health hazards. The volume also gives some guidance for future work in the identification of etiological agents responsible for urinary tract cancer and nephropathy in the Balkans.

In recent years more and more research has revealed that the gut has close relationships with many other organs such as the liver kidneys lungs brain and breasts. More and more research has revealed that gut microbes can adjust the functions of the hosts major organs such as the liver kidneys brain lungs and breasts. In other words the Gut X Axis has become a hot research topic in recent years. Herbal medicines have been used globally in the treatment of human and animal diseases for thousands of years. Traditional Chinese herbal medicines such as Glycyrrhiza spp and Astragalus membranaceus Bunge are examples of botanical drugs that have significant effects on the treatment of immune depression by adjusting the gut microbe. Silybum marianum originally distributed in the Mediterranean and other parts of Southern Europe and Northern Africa is now widely used to treat various liver diseases and modify the gut microbe. The active natural products in traditional Chinese medicine have also been studied on the Gut X Axis such as Atractylodes macrocephala polysaccharide AMP. Therefore research on the pharmacology toxicology microbiology and action mechanism of traditional medicines and active natural products via the Gut X Axis is essential to better understand their efficacy and to expand the development of drugs for the treatment of clinical diseases.
