Nanostructured Catalysts Susannah L. Scott, Cathleen M. Crudden, Christopher W. Jones, 2003-01-31 Table of contents

Nanostructured Catalysts for Environmental Applications Marco Piumetti, Samir Bensaid, 2021-01-20 This book offers an overview of the recent studies and advances in environmental catalysis by nanomaterials considering both the fundamental and the technological aspects. It offers contributions in different areas of environmental catalysis including the catalytic and photocatalytic abatement of environmentally hazardous effluents from stationary or mobile sources, the valorization of waste and the production of sustainable energy. In other words, this monograph provides an overview of modern environmental and energy related applications with a particular emphasis to nano-sized catalytic materials. Recent concepts, experimental data and advanced theories are reported in this book to give evidence of the environmental and sustainable applications that can be found in the highly interdisciplinary field of catalysis.

Nanostructured Catalysts Susannah L. Scott, Cathleen M. Crudden, Christopher W. Jones, 2008-04-06 With the recent advent of nanotechnology, research and development in the area of nanostructured materials has gained unprecedented prominence. Novel materials with potentially exciting new applications are being discovered at a much higher rate than ever before. Innovative tools to fabricate, manipulate, characterize and evaluate such materials are being developed and expanded. To keep pace with this extremely rapid growth, it is necessary to take a breath from time to time to critically assess the current knowledge and provide thoughts for future developments. This book represents one of these moments as a number of prominent scientists in nanostructured materials join forces to provide insightful reviews of their areas of expertise, thus offering an overall picture of the state of the art of the field. Nanostructured materials designate an increasing number of materials with designed shapes, surfaces, structures, pore systems, etc. Nanostructured materials with modified surfaces include those whose surfaces have been altered via such techniques as grafting and tethering of organic or organometallic species or through various deposition procedures including electroless and vapor deposition or simple adsorption. These materials find important applications in catalysis, separation and environmental remediation. Materials with patterned surfaces, which are essential for the optoelectronics industry, constitute another important class of surface-modified nanostructured materials. Other materials are considered nanostructured because of their composition and internal organization.

Nanostructured Catalysts Christian Hess, Robert Schlögl, 2011-07-22 The book gives a comprehensive up-to-date summary of the existing information on the structural, electronic properties, chemistry and catalytic properties of vanadium and molybdenum-containing catalysts. It discusses the importance of nanoscience for the controlled synthesis of catalysts with functional properties and introduces the necessary background regarding surface properties and preparation techniques, leading from a textbook level to the current state of knowledge. Then follows an extensive survey and analysis of the existing open and patent literature, an essential knowledge source for the development of the new generation of partial oxidation catalysts. Important examples from current research on

partial oxidation reactions are reviewed from experts in the field The next chapter discusses the importance of 2 and 3 dimensional model systems for a fundamental understanding of the structure of transition metal oxide catalysts and its correlation to reactivity Finally an outlook on research opportunities within the area of partial oxidation reactions is presented

Nanostructured Catalysts Christian Hess, Robert Schlögl, 2011 The book gives a comprehensive summary of the existing information on the structural electronic properties chemistry and catalytic properties of vanadium and molybdenum containing catalysts As at least one of these two elements is essential to most partial oxidation catalysts the book is of great interest to advanced students of catalysis and researchers both in academia and industry Despite major developments in the field the last book with a similar scope was published in 1989 and therefore a new book is overdue The book benefits largely from the fact that the subject is a major research focus at the Department of Inorganic Chemistry amongst other departments at the Fritz Haber Institute a world leading institution for catalysis research ensuring an up to date treatise Such an integrated approach including the relation of in situ spectroscopic results from real catalysts to those of model catalytic systems has not been accomplished before The introductory chapter discusses the importance of nanoscience for the controlled synthesis of catalysts with functional properties The following two chapters introduce the necessary background regarding surface properties and preparation techniques leading from a textbook level to the current state of knowledge The following chapter starts with an extensive survey and analysis of the existing open and patent literature which is an essential knowledge source for the development of the new generation of partial oxidation catalysts and will be of particular value to those developing new partial oxidation catalysts In the remaining subchapters important examples from current research on partial oxidation reactions are reviewed from experts in the field The next chapter discusses the importance of 2 and 3 dimensional model systems for a fundamental understanding of the structure of transition metal oxide catalysts and its correlation to reactivity These results are related to those of the real catalytic systems The last chapter gives an outlook on research opportunities within the area of partial oxidation reactions

Nanostructured Catalysts for the Development of the Hydrogen Economy Yen Hoang, 2015 Catalysis plays an essential role in many industrial applications such as petrochemical and biochemical industries as well as in the production of polymers and in environmental protection Design and fabrication of efficient catalysts in a cost effective way is an important milestone to address a number of unresolved issues in the new generation of chemical and energy conversion technologies The objective of the studies in this thesis is the development of facile synthetic routes to prepare efficient catalysts based on non noble metals and elucidate fundamental aspects regarding the relationship between structure composition and catalytic performance in particular in the case of processes related to production and storage of hydrogen fuel At first a series of nanostructured porous mixed metal oxides Cu CeO₂ CuFe CeO₂ CuCo CeO₂ CuFe₂O₄ NiFe₂O₄ have been synthesized via an improved nanocasting method The porous structure of the nanocast products was tailored by tuning the mesostructure of the mesoporous silica phases used as templates The obtained Cu CeO₂ materials with controlled composition and porous structure were then tested in preferential oxidation of CO in a hydrogen stream to achieve high purity hydrogen fuel The synthesized catalysts exhibit high activity and selectivity in selective oxidation of CO to CO₂ Regarding hydrogen storage we reported a cost effective synthetic way towards bi component CuO NiO catalyst showing excellent catalytic performance which is comparable to noble metal catalysts in the hydrogen generation from ammonia borane Moreover we demonstrate that the interaction between Cu and Ni species is essential in accelerating hydrogen evolution of ammonia borane The catalytic activity of the obtained catalyst investigated in this reaction is strongly influenced by the nature of the metal precursors the composition and the thermal treatment temperature employed for the catalyst preparation Finally silica and carbon supported Cu Ni nanocatalysts with tunable composition and metal particle size were synthesized by simple incipient wetness method The carbon supported catalysts are stable highly active and selective in both ammonia borane hydrolysis and the decomposition of hydrous hydrazine for hydrogen evolution We showed that optimal catalysts can be achieved through manipulation of bimetallic effect metal support interaction and adequate metal particle size
