Materials Research Agenda for the Automotive Industry

General and specific materials research opportunities were determined for the automotive industry using the 50-mpg, 5-passenger sedan as a basis for analysis. The general finding highlights the need for developing a materials-systems methodology and for approaching research issues in terms of the materials life cycle. The specific findings address advanced materials candidates and corresponding research needs for the major component subsystems of the vehicle.

NEED FOR MATERIALS-SYSTEMS APPROACH

Improved materials and materials processing can and must play a large role in generating productive and effective responses to the forces that will drive the automotive industry in the future. However, these forces often pull in diverse directions when specific technological actions are considered. For example, aluminum alloys can be used to reduce vehicle weight, thereby reducing emissions and improving fuel economy, but the added materials costs currently offset these advantages for many applications. As a result, steel is still the major material of choice for automobile construction today and will be difficult to supplant for the foreseeable future.

Materials Research Agenda for the Automobile and Aircraft Industries National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Commission on Engineering and Technical Systems, Committee on Materials for the 21st Century, 1993-02-01 This volume presents a materials research agenda for the commercial aircraft and automobile industries for the next two decades. Two case studies are used as a basis for discussion: the 50 mile per gallon 5 passenger sedan and the high speed civil transport. Also identified are those general materials drivers and the materials research required for each field.

Combat Vehicle Weight Reduction by Materials Substitution National Academies of Sciences, Engineering, and Medicine, Division on Engineering and Physical Sciences, National Materials and Manufacturing Board, Defense Materials Manufacturing and Infrastructure Standing Committee, 2018-11-12 Vehicle weight reduction is an effective strategy for reducing fuel consumption in civilian vehicles. For combat vehicles, it presents not only an important opportunity to reduce fuel use and associated logistics but also important advantages in transport and mobility on the battlefield. Although there have been numerous efforts in the past to reduce the overall weight of combat vehicles, combat vehicle weight has continued to increase over time due to new threats and missions. On December 8 and 9, 2014, the National Academies of Sciences Engineering and Medicine held a workshop to explore opportunities in lightweight materials for armored vehicles. This was the ninth workshop in an ongoing series for the U.S. military on materials and manufacturing issues. The workshop discussed future advances in weight reduction by materials substitution for vehicles, including such topics as armor structure, automotive parts, and armaments. This publication summarizes the presentations and discussions.
