Scaling-Up Equitable Nutritional Care for Girls and Women in South Asia Vani Sethi, Manisha Nair, Neena Bhatia, Zivai Murira, Charu Arora, Divya Tripathi, 2025-04-29 South Asia contributes to 40 per cent of the annual global low birth weight burden with an estimated 10 million children born with low birth weight. Poor women's nutrition and gender inequalities are the main causes for stagnantly high prevalence of low birth in South Asia. In South Asia most women enter pregnancy with one or more nutrition risks. 22% of women are too thin, 49% women are anaemic, 20% suffer from obesity, 10% are adolescents and 35% are too short for their age. The low diversity of diets of women is worrisome, particularly in fragile countries. For example, 26% of adolescent girls and women access a minimally diverse diets in Afghanistan. Data also shows that 90% of women in India, Bangladesh and Pakistan are affected with at least one of the three micronutrient deficiencies: iron, zinc and folate.

[The Role of Pregnancy Nutrition in Maternal and Offspring Health](#) Ekaterina Maslova, 2019-12-03 In pregnancy, maternal nutrition sustains and nourishes the developing child. Imbalances in either the direction of nutritional excess or deficiency can have adverse consequences for child health. In addition, more research now suggests that good pregnancy nutrition influences child health beyond pregnancy and delivery. This includes modifying the risk of child health outcomes as they enter childhood and adulthood through influences on placental development, hormonal pathways and organ structure and function. Poor pregnancy nutrition may also compromise maternal health during pregnancy, which may have long term consequences for women's health. Understanding the biological and social mechanisms operating during pregnancy can help in the design of better clinical and public health interventions. This Special Issue on The Role of Pregnancy Nutrition in Maternal and Offspring Health includes etiological and mechanistic studies of pregnancy nutrition with short and long term maternal and child health outcomes, including original research, narrative reviews and systematic reviews and meta-analyses. Together, this body of work provides important insights into the influence of dietary patterns, food groups and nutrients on pregnancy outcomes and long term neurodevelopmental, respiratory and metabolic health in the children. It also highlights nutritional consequences for specific groups of women, including those with pregnancy complications and eating disorders.

Maternal Nutrition and Child Health Douglas R. Shanklin, Jay Hodin, 1979 Abstract The nutritional status of the pregnant women is being recognized as one of the most important factors in the development of a baby both pre and postnatally Malnutrition can cause sterility spontaneous abortion stillbirth premature birth deformities and mental retardation Statistics from many sources such as European clinics during WWII and current figures from hospital observations all over the country have been collected and compiled to provide information on prenatal and early childhood development in relation to nutrition in three ways physiologically neurologically and behaviorally Low birth weight is the measurement most closely associated with the incidence of neonatal disorders and is shown to be closely related also to maternal nutrition Reproductive casualties particularly in regard to handicapped children can be greatly decreased by better education and nourishment of expectant mothers **Size at Birth** Katherine Elliott, Julie Knight, 2009-09-16 The Novartis Foundation Series is a popular collection of the proceedings from Novartis Foundation Symposia in which groups of leading scientists from a range of topics across biology chemistry and medicine assembled to present papers and discuss results The Novartis Foundation originally known as the Ciba Foundation is well known to scientists and clinicians around the world

Functional Nutritional Strategies as Alternatives to Antimicrobials Matteo Dell'Anno, Luciana Rossi, Francesca Riva, Monika Hejna, 2025-12-08 The field of veterinary medicine is currently grappling with the challenge of antimicrobial resistance a problem exacerbated by the misuse and overuse of antimicrobials in the last decades This has led to stricter regulations and a pressing need for alternative approaches that can maintain the effectiveness of antimicrobial treatments while limiting the development of resistance The exploration of functional nutritional strategies including the use of functional feed additives and ingredients such as natural extracts and agro industrial by products has emerged as a promising avenue These strategies which include the supplementation of probiotics prebiotics and plant extracts have the potential to protect animals against diseases enhance their health and promote the sustainability of livestock and pet practices The primary aim of this Research Topic is to delve into the potential of functional nutritional strategies as viable

alternatives to antibiotic treatments in both livestock and pets. The goal is to showcase cutting edge original articles and reviews that highlight the effectiveness, mechanisms of action and practical applications of these nutritional strategies in preventing microbial infections, enhancing animal health and promoting sustainable farming practices. We seek to investigate the potential of agricultural waste valorization, natural extracts and microbial products in promoting animal health and mitigating the occurrence of pathological conditions all while considering the positive impact on human and environmental health. The scope of this Research Topic is twofold. Firstly it involves studies that evaluate innovative dietary strategies as viable alternatives to antibiotic treatments in both livestock and pets. Secondly it invites authors to submit articles and reviews exploring the characteristics, efficacy, mechanisms and practical applications of functional products. This includes but is not limited to the following themes: The role of probiotics, prebiotics, plant extracts, essential oils and other functional additives or ingredients in modulating the microbiome, immune system, metabolome and proteome. Strategies for enhancing oxidative stress and reducing the occurrence of pathology. The positive impacts of feeding strategies on animal, human and environmental health. Through this comprehensive exploration the Research Topic aims to enrich the scientific knowledge of functional nutritional strategies and their significance in reducing antibiotic use and promoting animal health and welfare.

Maternal nutritional status affects the offspring's health development significantly during early embryogenesis, pregnancy, birth and lactation and subsequently determines health during growth and even throughout adulthood. On the other end of the human lifetime scale the importance of maternal nutrition expands into the time period before conception. Pre conception nutritional status not only influences fertility but also embryogenesis and life long health. Predisposition for coronary heart diseases, Type 2 diabetes mellitus and hypertension can be caused by intrauterine adaptations to fetal malnutrition. Hence optimizing nutrition for women during their reproductive period can be expected to have a great impact on the well being of the next generation. This workshop dealt with the effects of maternal nutrition on fetal growth, metabolic programming, energy and nutrient requirements as well as under and over nutrition during pregnancy. Finally it addressed the question of whether a distinct diet during pregnancy could reduce food allergy in the progeny. This book is a valuable and complete source of knowledge for all professionals involved in pediatrics, nutrition, policy, women's health, immunology, epidemiology and public health. **Oxford Textbook of Global Health of Women, Newborns, Children, and Adolescents** Delan Devakumar, Jennifer Hall, Zeshan Qureshi, Joy Lawn, 2019. Morrison,2017 Maternal nutrition during pregnancy is of considerable interest to women their partners and their health care professionals In developing countries maternal undernutrition is a major concern However with the increased prevalence of abundant high calorie diets their impact upon pregnancy outcome is of concern In addition to the amount of nutrition available and its macronutrient composition within a diet there is emerging evidence highlighting important roles for the lesser studied micronutrients Added to this complexity is the distinction between maternal and fetal nutrition and the impact the placenta plays in nutrient metabolism and overall nutrient supply to the fetus Together these many variables contribute to placental development and function fetal growth and where placental fetal nutrition and growth is compromised through poor maternal diet and or diet induced alterations in placental metabolism the impact is dramatic and can lead to lifelong implications for the offspring This Special Issue book aims to highlight research in many of these areas **Maternal Nutrition and the Course of Pregnancy** National Research Council (U.S.).
