Introduction to Intersection Theory in Algebraic Geometry William Fulton,1984 Introduces some of the main ideas of modern intersection theory traces their origins in classical geometry and sketches a few typical applications Suitable for graduate students in mathematics this book describes the construction and computation of intersection products by means of the geometry of normal cones **Some Problems of Unlikely Intersections in Arithmetic and Geometry** Umberto Zannier,2012-03-25 This book considers the so called Unlikely Intersections a topic that embraces well known issues such as Lang s and Manin Mumford s concerning torsion points in subvarieties of tori or abelian varieties More generally the book considers algebraic subgroups that meet a given subvariety in a set of unlikely dimension The book is an expansion of the Hermann Weyl Lectures delivered by Umberto Zannier at the Institute for Advanced Study in Princeton in May 2010 The book consists of four chapters and seven brief appendixes the last six by David Masser The first chapter considers multiplicative algebraic groups presenting proofs of several developments ranging from the origins to recent results and discussing many applications and relations with other contexts The second chapter considers an analogue in arithmetic and several applications of this The third chapter introduces a new method for approaching some of these questions and presents a detailed application of this by Masser and the author to a relative case of the Manin Mumford issue The fourth chapter focuses on the Andr Oort conjecture outlining work by Pila **Math Intersections** Joyce Glatzer,1990 Challenge students to solve problems and explain their processes as they diagram problems determine true or false statements describe a problem without answering it and demonstrate an understanding of terminology Reproducible **99 Points of Intersection** Hans Walser,2006-09-14 Translated from the original German by Peter Hilton and Jean Pedersen The 99 points of intersection presented here were collected during a year long search for surprising concurrence of lines For each example we find compelling evidence for the sometimes startling fact that in a geometric figure three straight lines or sometimes circles pass through one and the same point Of course we are familiar with some examples of this from basic elementary geometry the intersection of medians altitudes angle bisectors and perpendicular bisectors of sides of a triangle Here there are many more examples some for figures other than triangles some where even more than three straight lines pass through a common point The main part of the book presents 99 points of intersection purely visually They are developed in a sequence of figures many without caption or verbal commentary In addition the book contains general thoughts on and examples of the points of intersection as well as some typical methods of proving their existence Many of the examples shown in the book were inspired by questions and suggestions made by students and high school teachers Several of those examples have not only a geometrical but also an intriguing aesthetic aspect The book addresses high school students and students at the undergraduate level as well as their teachers but will appeal to anyone interested in geometry *Joins and Intersections* H. Flenner,L. O'Carroll,W. Vogel,2013-06-29 Dedicated to the memory of Wolfgang Classical Intersection Theory see for

example Wei Wei treats the case of proper intersections where geometrical objects usually subvarieties of a non singular variety intersect with the expected dimension In 1984 two books appeared which surveyed and developed work by the individual authors co workers and others on a refined version of Intersection Theory treating the case of possibly improper intersections where the intersection could have ex cess dimension The first by W Fulton Full recently revised in updated form used a geometrical theory of deformation to the normal cone more specifically deformation to the normal bundle followed by moving the zero section to make the intersection proper this theory was due to the author together with R MacPherson and worked generally for intersections on algeb raic manifolds It represents nowadays the standard approach to Intersection Theory The second by W Vogel Vogl employed an algebraic approach to inter sections although restricted to intersections in projective space it produced an intersection cycle by a simple and natural algorithm thus leading to a Bezout theorem for improper intersections It was developed together with J Stiickrad and involved a refined version of the classical technique ofreduc tion to the diagonal here one starts with the join variety and intersects with successive hyperplanes in general position laying aside components which fall into the diagonal and intersecting the residual scheme with the next hyperplane since all the hyperplanes intersect in the diagonal the process terminates   *Intersection Theory* William Fulton,2012-12-06 From the ancient origins of algebraic geometry in the solutions of polynomial equations through the triumphs of algebraic geometry during the last two centuries intersection theory has played a central role The aim of this book is to develop the foundations of this theory and to indicate the range of classical and modern applications Although a comprehensive history of this vast subject is not attempted the author points out some of the striking early appearances of the ideas of intersection theory A suggested prerequisite for the reading of this book is a first course in algebraic geometry Fulton s introduction to intersection theory has been well used for more than 10 years It is still the only existing complete modern treatise of the subject and received the Steele Prize for best exposition in August 1996   **Recent Progress in Intersection Theory** Geir Ellingsrud,William Fulton,Angelo Vistoli,2012-12-06 The articles in this volume are an outgrowth of an International Confer ence in Intersection Theory that took place in Bologna Italy December 1997 In a somewhat unorthodox format aimed at both the mathematical community as well as summer school students talks were research oriented as well as partly expository There were four series of expository talks by the following people M Brion University of Grenoble on Equivariant Chow groups and applications H Flenner University of Bochum on Joins and intersections E M Friedlander Northwestern University on Intersection products for spaces of algebraic cycles R Laterveer University of Strasbourg on Bigraded Chow co homology Four introductory papers cover the following topics and bring the reader to the forefront of research 1 the excess intersection algorithm of Stuckrad and Vogel combined with the deformation to the normal cone together with many of its geo metric applications 2 new and very important homotopy theory techniques that are now used in intersection theory 3 the Bloch Beilinson filtration and the theory of motives 4 algebraic stacks the modern language of moduli theory Other research

Fulton,2013-06-29 From the ancient origins of algebraic geometry in the solution of polynomial equations through the triumphs of algebraic geometry during the last two cen turies intersection theory has played a central role Since its role in founda tional crises has been no less prominent the lack of a complete modern treatise on intersection theory has been something of an embarrassment The aim of this book is to develop the foundations of intersection theory and to indicate the range of classical and modern applications Although a comprehensive his tory of this vast subject is not attempted we have tried to point out some of the striking early appearances of the ideas of intersection theory Recent improvements in our understanding not only yield a stronger and more useful theory than previously available but also make it possible to devel op the subject from the beginning with fewer prerequisites from algebra and algebraic geometry It is hoped that the basic text can be read by one equipped with a first course in algebraic geometry with occasional use of the two appen dices Some of the examples and a few of the later sections require more spe cialized knowledge The text is designed so that one who understands the con structions and grants the main theorems of the first six chapters can read other chapters separately Frequent parenthetical references to previous sections are included for such readers The summaries which begin each chapter should fa cilitate use as a reference   **Isolated Singular Points on Complete Intersections** Eduard Looijenga,1984-03 This book will be of use to professional mathematicians working in algebraic geometry complex analytical geometry and to some extent differential analysis   Recent Progress in Intersection Theory Geir Ellingsrud,William Fulton,Angelo Vistoli,2000-02-25 The articles in this volume are an outgrowth of an International Confer ence in Intersection Theory that took place in Bologna Italy December 1997 In a somewhat unorthodox format aimed at both the mathematical community as well as summer school students talks were research oriented as well as partly expository There were four series of expository talks by the following people M Brion University of Grenoble on Equivariant Chow groups and applications H Flenner University of Bochum on Joins and intersections E M Friedlander Northwestern University on Intersection products for spaces of algebraic cycles R Laterveer University of Strasbourg on Bigraded Chow co homology Four introductory papers cover the following topics and bring the reader to the forefront of research 1 the excess intersection algorithm of Stuckrad and Vogel combined with the deformation to the normal cone together with many of its geo metric applications 2 new and very important homotopy theory techniques that are now used in intersection theory 3 the Bloch Beilinson filtration and the theory of motives 4 algebraic stacks the modern language of moduli theory Other research articles concern such active fields as stable maps and Gromov Witten invariants deformation theory of complex varieties and
