Multiresolution Methods In Scattered Data Modelling:

Multiresolution Methods in Scattered Data Modelling Armin Iske, 2004-04-01 This application oriented work concerns the design of efficient robust and reliable algorithms for the numerical simulation of multiscale phenomena To this end various modern techniques from scattered data modelling such as splines over triangulations and radial basis functions are combined with customized adaptive strategies which are developed individually in this work The resulting multiresolution methods include thinning algorithms multi level approximation schemes and meshfree discretizations for transport equations The utility of the proposed computational methods is supported by their wide range of applications such as image compression hierarchical surface visualization and multiscale flow simulation Special emphasis is placed on comparisons between the various numerical algorithms developed in this work and comparable state of the art methods To this end extensive numerical examples mainly arising from real world applications are provided This research monograph is arranged in six chapters 1 Introduction 2 Algorithms and Data Structures 3 Radial Basis Functions 4 Thinning Algorithms 5 Multilevel Approximation Schemes 6 Meshfree Methods for Transport Equations Chapter 1 provides a preliminary discussion on basic concepts tools and principles of multiresolution methods scattered data modelling multilevel methods and adaptive irregular sampling Relevant algorithms and data structures such as triangulation methods heaps and quadrees are then introduced in Chapter 2

Multiscale Modeling and Simulation in Science Björn Engquist, Per Lötstedt, Olof Runborg, 2009-02-11 Most problems in science involve many scales in time and space An example is turbulent flow where the important large scale quantities of lift and drag of a wing depend on the behavior of the small vortices in the boundary layer Another example is chemical reactions with concentrations of the species varying over seconds and hours while the time scale of the oscillations of the chemical bonds is of the order of femtoseconds A third example from structural mechanics is the stress and strain in a solid beam which is well described by macroscopic equations but at the tip of a crack modeling details on a microscale are needed A common difficulty with the simulation of these problems and many others in physics chemistry and biology is that an attempt to represent all scales will lead to an enormous computational problem with unacceptably long computation times and large memory requirements On the other hand if the discretization at a coarse level ignores the mesoscale information then the solution will not be physically meaningful The influence of the mesoscales must be incorporated into the model This volume is the result of a Summer School on Multiscale Modeling and Simulation in Science held at Bosön Lidingö outside Stockholm Sweden in June 2007 Sixty PhD students from applied mathematics the sciences and engineering participated in the summer school

Meshfree Approximation Methods with MATLAB Gregory E. Fasshauer, 2007 Meshfree approximation methods are a relatively new area of research This book provides the salient theoretical results needed for a basic understanding of meshfree approximation methods It places emphasis on a hands on approach that includes MATLAB routines for all basic operations

Spectral and High Order Methods for Partial Differential Equations ICOSAHOM 2018

Spencer J. Sherwin, David Moxey, Joaquim Peiró, Peter E. Vincent, Christoph Schwab, 2020-08-11 This open access book features a selection of high quality papers from the presentations at the International Conference on Spectral and High Order Methods 2018 offering an overview of the depth and breadth of the activities within this important research area The carefully reviewed papers provide a snapshot of the state of the art while the extensive bibliography helps initiate new research directions

Modeling, Simulation and Optimization of Fluid Dynamic Applications Armin Iske, Thomas Rung, 2023-12-13 This book describes recent collaborations combining the expertise of applied mathematicians engineers and geophysicists within a research training group RTG on Modeling Simulation and Optimization of Fluid Dynamic Applications funded by the Deutsche Forschungsgemeinschaft DFG The focus is on mathematical modeling adaptive discretization approximation strategies and shape optimization with PDEs The balanced research program is based on the guiding principle that mathematics drives applications and is inspired by applications With this leitmotif the RTG advances research in Modeling Simulation and Optimization by an interdisciplinary approach i e to stimulate fundamental education and research by highly complex applications and at the simultaneously transfer tailored mathematical methods to applied sciences The reported research involves nine projects and addresses challenging fluid dynamic problems inspired by applied sciences such as climate research meteorology energy aerospace marine engineering or medicine More fundamental research concerning analysis approximation and numerics is also covered The material represents a successful attempt to exchange research paradigms between different disciplines and thus displays a modern approach to basic research into scientifically and societally relevant contemporary problems

Approximation Theory XV: San Antonio 2016 Gregory E. Fasshauer, Larry L. Schumaker, 2017-07-19 These proceedings are based on papers presented at the international conference Approximation Theory XV which was held May 22 25 2016 in San Antonio Texas The conference was the fifteenth in a series of meetings in Approximation Theory held at various locations in the United States and was attended by 146 participants The book contains longer survey papers by some of the invited speakers covering topics such as compressive sensing isogeometric analysis and scaling limits of polynomials and entire functions of exponential type The book also includes papers on a variety of current topics in Approximation Theory drawn from areas such as advances in kernel approximation with applications approximation theory and algebraic geometry multivariate splines for applications practical function approximation approximation of PDEs wavelets and framelets with applications approximation theory in signal processing compressive sensing rational interpolation spline approximation in isogeometric analysis approximation of fractional differential equations numerical integration formulas and trigonometric polynomial approximation

Meshfree Methods for Partial Differential Equations III Michael Griebel, Marc Alexander Schweitzer, 2007-07-18 Meshfree methods for the numerical solution of partial differential equations are becoming more and more mainstream in many areas of applications Their flexibility and wide applicability are attracting engineers scientists and mathematicians to this very dynamic research area This volume represents the state of

the art in meshfree methods It consists of articles which address the different meshfree techniques their mathematical properties and their application in applied mathematics physics and engineering

Computational Methods in Transport Frank Graziani, 2006-02-17 There exist a wider range of applications where a signi cant fraction of the momentum and energy present in a physical problem is carried by the transport of particles Depending on the specific application the particles involved may be photons neutrons neutrinos or charged particles Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann like transport equation has to be solved The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional 3 spatial coordinates 2 angles 1 time and 1 for speed or energy Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate Another approximation is the grey approximation which drops the energy variable by averaging over it If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics It is clear therefore that for those application areas needing some form of transport fast accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution
