System Identification R. Isermann, 2014-05-23 System Identification is a special section of the International Federation of Automatic Control IFAC Journal Automatica that contains tutorial papers regarding the basic methods and procedures

utilized for system identification Topics include modeling and identification step response and frequency response methods correlation methods least squares parameter estimation and maximum likelihood and prediction error methods After analyzing the basic ideas concerning the parameter estimation methods the book elaborates on the asymptotic properties of these methods and then investigates the application of the methods to particular model structures The text then discusses the practical aspects of process identification which includes the usual general procedures for process identification selection of input signals and sampling time offline and on line identification comparison of parameter estimation methods data filtering model order testing and model verification Computer program packages are also discussed This compilation of tutorial papers aims to introduce the newcomers and non specialists in this field to some of the basic methods and procedures used for system identification *Library of Congress Catalog Library of Congress,1980-07*

Data Driven Strategies Wang Jianhong,Ricardo A. Ramirez-Mendoza,Ruben Morales-Menendez,2023-03-31 A key challenge in science and engineering is to provide a quantitative description of the systems under investigation leveraging the noisy data collected Such a description may be a complete mathematical model or a mechanism to return controllers corresponding to new unseen inputs Recent advances in the theories are described in detail along with their applications in engineering The book aims to develop model free system analysis and control strategies i e data driven control from theoretical analysis and engineering applications based only on measured data The study aims to develop system identification and combination in advanced control theory i e data driven control strategy as system and controller are generated from measured data directly The book reviews the development of system identification and its combination in advanced control theory i e data driven control strategy as they all depend on measured data Firstly data driven identification is developed for the closed loop nonlinear system and model validation i e obtaining model descriptions from measured data Secondly the data driven idea is combined with some control strategies to be considered data driven control strategies such as data driven model predictive control data driven iterative tuning control and data driven subspace predictive control Thirdly data driven identification and data driven control strategies are applied to interested engineering In this context the book provides algorithms to perform state estimation of dynamical systems from noisy data and some convex optimization algorithms through identification and control problems
