Multigrid Methods III International Series Of Numerical Mathematics Volume 98:

Multigrid Methods III HACKBUSCH, TROTENBER, 2013-11-22 These proceedings contain a selection of papers presented at the Third European Conference on Multigrid Methods which was held in Bonn on October 1-4 1990. Following conferences in 1981 and 1985 a platform for the presentation of new Multigrid results was provided for a third time.

Multigrid methods no longer have problems being accepted by numerical analysts and users of numerical methods on the contrary they have been further developed in such a successful way that they have penetrated a variety of new fields of application. The high number of 154 participants from 18 countries and 76 presented papers show the need to continue the series of the European Multigrid Conferences. The papers of this volume give a survey on the current Multigrid situation in particular they correspond to those fields where new developments can be observed. For example several papers study the appropriate treatment of time dependent problems. Improvements can also be noticed in the Multigrid approach for semiconductor equations. The field of parallel Multigrid variants having been started at the second European Multigrid Conference is now at the centre of interest.

Multigrid Techniques Achi Brandt, Oren E. Livne, 2011-07-07 This revised edition of a classic text presents the best practices of developing multigrid solvers for large scale computational problems. This book will be useful to practitioners and researchers as well as students and instructors in many areas of computational science and engineering applied mathematics and numerical analysis.

Partial Differential Equations D. Sloan, S. Vandewalle, E. Süli, 2012-12-02 homepage sac.cam.ac.uk/na2000/index.html7 Volume Set now available at special set price. Over the second half of the 20th century the subject area loosely referred to as numerical analysis of partial differential equations (PDEs) has undergone unprecedented development. At its practical end the vigorous growth and steady diversification of the field were stimulated by the demand for accurate and reliable tools for computational modelling in physical sciences and engineering and by the rapid development of computer hardware and architecture. At the more theoretical end the analytical insight into the underlying stability and accuracy properties of computational algorithms for PDEs was deepened by building upon recent progress in mathematical analysis and in the theory of PDEs. To embark on a comprehensive review of the field of numerical analysis of partial differential equations within a single volume of this journal would have been an impossible task. Indeed the 16 contributions included here by some of the foremost world authorities in the subject represent only a small sample of the major developments. We hope that these articles will nevertheless provide the reader with a stimulating glimpse into this diverse, exciting and important field. The opening paper by Thomé reviews the history of numerical analysis of PDEs starting with the 1928 paper by Courant, Friedrichs and Lewy on the solution of problems of mathematical physics by means of finite differences. This excellent survey takes the reader through the development of finite differences for elliptic problems from the 1930s and the intense study of finite differences for general initial value problems during the 1950s and 1960s. The formulation of the concept of stability is explored in the Lax equivalence theorem and the Kreiss matrix lemmas.

Reference is made to the introduction of the finite element method by structural engineers and a description is given of the subsequent development and mathematical analysis of the finite element method with piecewise polynomial approximating functions. The penultimate section of Thomas's survey deals with other classes of approximation methods and this covers methods such as collocation methods, spectral methods, finite volume methods and boundary integral methods. The final section is devoted to numerical linear algebra for elliptic problems. The next three papers by Bialecki and Fairweather, Hesthaven and Gottlieb and Dahmen describe respectively spline collocation methods, spectral methods and wavelet methods. The work by Bialecki and Fairweather is a comprehensive overview of orthogonal spline collocation from its first appearance to the latest mathematical developments and applications. The emphasis throughout is on problems in two space dimensions. The paper by Hesthaven and Gottlieb presents a review of Fourier and Chebyshev pseudospectral methods for the solution of hyperbolic PDEs. Particular emphasis is placed on the treatment of boundaries, stability of time discretisations, treatment of non-smooth solutions and multidomain techniques. The paper gives a clear view of the advances that have been made over the last decade in solving hyperbolic problems by means of spectral methods but it shows that many critical issues remain open. The paper by Dahmen reviews the recent rapid growth in the use of wavelet methods for PDEs. The author focuses on the use of adaptivity where significant successes have recently been achieved. He describes the potential weaknesses of wavelet methods as well as the perceived strengths thus giving a balanced view that should encourage the study of wavelet methods.

Computational Optimization of Systems Governed by Partial Differential Equations Alfio Borzi, Volker Schulz, 2012-01-26. This book provides a bridge between continuous optimization and PDE modelling and focuses on the numerical solution of the corresponding problems. Intended for graduate students in PDE constrained optimization it is also suitable as an introduction for researchers in scientific computing or optimization.
