Multimedia Databases In Perspective:

Multimedia Database in Perspective Peter M.G. Apers, Henk M. Blanken, Maurice A.W. Houtsma, 2012-12-06 During the last decade multimedia has emerged as a major research and development area. Pushed by advanced technology like huge capacity storage devices, fast networks and powerful work stations, new applications have arisen. Many definitions of multimedia systems exist, one of them being computer systems that support interactive use of at least one of the following information sources: graphics, image, voice, sound, and video. These systems have caused a boom in the world of entertainment but also in other business areas. Great opportunities for novel products and services are available. The size of multimedia data is often huge and the storage of huge amounts of data is a task normally allocated to database management systems. Although some modern database management systems offer facilities to support development of multimedia applications, many problems related to multimedia support are still not well understood. This book reports on research efforts to solve some of these problems. An introductory knowledge of databases and also of operating systems and network technology is assumed. The book is very suitable as material for courses at senior or graduate level but also for upgrading the skills of computer scientists working on database management systems, multimedia systems or applications. The book consists of four parts. Part I is called Requirements for a Multimedia Database and comprises chapters one to three. Chapter one presents an outline of the book.

Instructional Design: International Perspectives II Sanne Dijkstra, Franz Schott, Norbert Seel, Robert D. Tennyson, Norbert M. Seel, 2014-03-18 Instructional design theory and practice has evolved over the past 30 years from an initial narrow focus on programmed instruction to a multidimensional field of study integrating psychology, technology, evaluation, measurement, and management. The growth of instructional design (ID) has occurred because of direct needs, problems, and goals from society. Its application in planning instruction first developed in the United States with the Department of Defense during World War II with the purpose of meeting immediate concerns for effective training of larger numbers of military personnel. From the beginning ID has rapidly expanded into applications in industrial and executive training, vocational training, classroom learning, and professional education. Although ID has its roots in the U.S., applications and theoretical growth is an international activity. However, literature at the international level is still limited to either individual author contributions or collections primarily represented by single countries. As a result, there is no standard reference source that contains the rich variety of theories and applications to form the international foundation for the field. The goal of this two-volume set is to establish international foundations for ID theory, research, and practice within the framework of the two following objectives: to identify and define the theoretical research and model foundations for ID and to bridge the gap between ID foundations and application. Volume I includes chapters on philosophical and theoretical issues on learning theory and ID models. Volume II provides an overview of the state of the art of solving ID problems. The contributors offer contrasting points of view which provide a rare opportunity to see the diversity and complexity in the field. The editorial

committee has selected a wide range of internationally known authors to make presentations in the topic areas of the field

Content-Based Video Retrieval Milan Petković, Willem Jonker, 2003-10-31 The area of content based video retrieval is a very hot area both for research and for commercial applications In order to design effective video databases for applications such as digital libraries video production and a variety of Internet applications there is a great need to develop effective techniques for content based video retrieval One of the main issues in this area of research is how to bridge the semantic gap between low level features extracted from a video such as color texture shape motion and others and semantics that describe video concept on a higher level In this book Dr Milan Petković and Prof Dr Willem Jonker have addressed this issue by developing and describing several innovative techniques to bridge the semantic gap The main contribution of their research which is the core of the book is the development of three techniques for bridging the semantic gap 1 a technique that uses the spatio temporal extension of the Cobra framework 2 a technique based on hidden Markov models and 3 a technique based on Bayesian belief networks To evaluate performance of these techniques the authors have conducted a number of experiments using real video data The book also discusses domain solutions versus general solution of the problem Petković and Jonker proposed a solution that allows a system to be applied in multiple domains with minimal adjustments They also designed and described a prototype video database management system which is based on techniques they proposed in the book
