Multiple Processor Systems for Real-time Applications Burt H. Liebowitz, John Hargadine Carson, 1985

Multi-Processor System-on-Chip 1 Liliana Andrade, Frederic Rousseau, 2021-05-11 A Multi Processor System on Chip MPSoC is the key component for complex applications. These applications put huge pressure on memory communication devices and computing units. This book presented in two volumes Architectures and Applications therefore celebrates the 20th anniversary of MPSoC an interdisciplinary forum that focuses on multi core and multi processor hardware and software systems. It is this interdisciplinarity which has led to MPSoC bringing together experts in these fields from around the world over the last two decades. Multi Processor System on Chip 1 covers the key components of MPSoC processors memory interconnect and interfaces. It describes advance features of these components and technologies to build efficient MPSoC architectures. All the main components are detailed use of memory and their technology communication support and consistency and specific processor architectures for general purposes or for dedicated applications

System-Level HW/SW Co-Design of Heterogeneous Multi-Processor Embedded Systems Luigi Pomante, 2022-09-01

Modern electronic systems consist of a fairly heterogeneous set of components. Today a single system can be constituted by a hardware platform frequently composed of a mix of analog and digital components and by several software application layers. The hardware can include several heterogeneous microprocessors e.g. GPP, DSP, GPU, etc. dedicated ICs, ASICs, and/or FPGAs, memories, a set of local connections between the system components and some interfaces between the system and the environment, sensors, actuators, etc. Therefore, on the one hand, multi-processor embedded systems are capable of meeting the demand of processing power and flexibility of complex applications. On the other hand, such systems are very complex to design and optimize so that the design methodology plays a major role in determining the success of the products. For these reasons, to cope with the increasing system complexity, the approaches typically used today are oriented towards co-design methodologies working at the higher levels of abstraction. Unfortunately, such methodologies are typically customized for the specific application, suffer of a lack of generality, and still need a considerable effort when real-size projects are envisioned. Therefore, there is still the need for a general methodology able to support the designer during the high-level steps of a co-design flow, enabling an effective design space exploration before tackling the low-level steps and thus committing to the final technology. This should prevent costly redesign loops. In such a context, the work described in this book, composed of two parts, aims at providing models, methodologies, and tools to support each step of the co-design flow of embedded systems implemented by exploiting heterogeneous multi-processor architectures mapped on distributed systems as well as fully integrated onto a single chip
