Multiresolution Methods In Scattered Data Modelling:

Multiresolution Methods in Scattered Data Modelling Armin Iske, 2004-04-01 This application oriented work concerns the design of efficient robust and reliable algorithms for the numerical simulation of multiscale phenomena To this end various modern techniques from scattered data modelling such as splines over triangulations and radial basis functions are combined with customized adaptive strategies which are developed individually in this work The resulting multiresolution methods include thinning algorithms multi level approximation schemes and meshfree discretizations for transport equations The utility of the proposed computational methods is supported by their wide range of applications such as image compression hierarchical surface visualization and multiscale flow simulation Special emphasis is placed on comparisons between the various numerical algorithms developed in this work and comparable state of the art methods To this end extensive numerical examples mainly arising from real world applications are provided This research monograph is arranged in six chapters 1 Introduction 2 Algorithms and Data Structures 3 Radial Basis Functions 4 Thinning Algorithms 5 Multilevel Approximation Schemes 6 Meshfree Methods for Transport Equations Chapter 1 provides a preliminary discussion on basic concepts tools and principles of multiresolution methods scattered data modelling multilevel methods and adaptive irregular sampling Relevant algorithms and data structures such as triangulation methods heaps and quadrees are then introduced in Chapter 2

Multiscale Modeling and Simulation in Science Björn Engquist, Per Lötstedt, Olof Runborg, 2009-02-11 Most problems in science involve many scales in time and space An example is turbulent flow where the important large scale quantities of lift and drag of a wing depend on the behavior of the small vortices in the boundary layer Another example is chemical reactions with concentrations of the species varying over seconds and hours while the time scale of the oscillations of the chemical bonds is of the order of femtoseconds A third example from structural mechanics is the stress and strain in a solid beam which is well described by macroscopic equations but at the tip of a crack modeling details on a microscale are needed A common difficulty with the simulation of these problems and many others in physics chemistry and biology is that an attempt to represent all scales will lead to an enormous computational problem with unacceptably long computation times and large memory requirements On the other hand if the discretization at a coarse level ignores the mesoscale information then the solution will not be physically meaningful The influence of the mesoscales must be incorporated into the model This volume is the result of a Summer School on Multiscale Modeling and Simulation in Science held at Bosön Lidingö outside Stockholm Sweden in June 2007 Sixty PhD students from applied mathematics the sciences and engineering participated in the summer school

Meshfree Methods for Partial Differential Equations III Michael Griebel, Marc Alexander Schweitzer, 2007-07-18 Meshfree methods for the numerical solution of partial differential equations are becoming more and more mainstream in many areas of applications Their flexibility and wide applicability are attracting engineers scientists and mathematicians to this very dynamic research area This volume represents the state of

the art in meshfree methods It consists of articles which address the different meshfree techniques their mathematical properties and their application in applied mathematics physics and engineering

Computational Methods in Transport Frank Graziani, 2006-02-17 There exist a wider range of applications where a signi cant fraction of the momentum and energy present in a physical problem is carried by the transport of particles Depending on the specific application the particles involved may be photons neutrons neutrinos or charged particles Regardless of which phenomena is being described at the heart of each application is the fact that a Boltzmann like transport equation has to be solved The complexity and hence expense involved in solving the transport problem can be understood by realizing that the general solution to the 3D Boltzmann transport equation is in fact really seven dimensional 3 spatial coordinates 2 angles 1 time and 1 for speed or energy Low order approximations to the transport equation are frequently used due in part to physical justification but many in cases simply because a solution to the full transport problem is too computationally expensive An example is the diffusion equation which effectively drops the two angles in phase space by assuming that a linear representation in angle is adequate Another approximation is the grey approximation which drops the energy variable by averaging over it If the grey approximation is applied to the diffusion equation the expense of solving what amounts to the simplest possible description of transport is roughly equal to the cost of implicit computational fluid dynamics It is clear therefore that for those application areas needing some form of transport fast accurate and robust transport algorithms can lead to an increase in overall code performance and a decrease in time to solution
