Understanding Nonlinear Dynamics Daniel Kaplan, Leon Glass, 2012-12-06 Mathematics is playing an ever more important role in the physical and biological sciences provoking a blurring of boundaries between scientific disciplines and a resurgence of interest in the modern as well as the classical techniques of applied mathematics This renewal of interest both in research and teaching has led to the establishment of the series Texts in Applied Mathematics TAM The development of new courses is a natural consequence of a high level of excitement on the research frontier as newer techniques such as numerical and symbolic computer systems dynamical systems and chaos mix with and reinforce the traditional methods of applied mathematics Thus the purpose of this textbook series is to meet the current and future needs of these advances and encourage the teaching of new courses TAM will publish textbooks suitable for use in advanced undergraduate and beginning graduate courses and will complement the Applied Mathematical Sciences AMS series which will focus on advanced textbooks and research level monographs About the Authors Daniel Kaplan specializes in the analysis of data using techniques motivated by nonlinear dynamics His primary interest is in the interpretation of irregular physiological rhythms but the methods he has developed have been used in geo physics economics marine ecology and other fields He joined McGill in 1991 after receiving his Ph D from Harvard University and working at MIT His undergraduate studies were completed at Swarthmore College He has worked with several instrumentation companies to develop novel types of medical monitors

Applications of Nonlinear Dynamics Visarath In, Patrick Longhini, Antonio Palacios, 2009-02-11 The eld of applied nonlinear dynamics has attracted scientists and engineers across many different disciplines to develop innovative ideas and methods to study c plex behavior exhibited by relatively simple systems Examples include population dynamics uidization processes applied optics stochastic resonance ocking and ightformations lasers andmechanicalandelectricaloscillators Acommontheme among these and many other examples is the underlying universal laws of nonl ear science that govern the behavior in space and time of a given system These laws are universal in the sense that they transcend the model speci c features of a system and so they can be readily applied to explain and predict the behavior of a wide ranging phenomena natural and arti cial ones Thus the emphasis in the past decades has been in explaining nonlinear phenomena with signi cantly less att tion paid to exploiting the rich behavior of nonlinear systems to design and fabricate new devices that can operate more ef ciently Recently there has been a series of meetings on topics such as Experimental Chaos Neural Coding and Stochastic Resonance which have brought together many researchers in the eld of nonlinear dynamics to discuss mainly theoretical ideas that may have the potential for further implementation In contrast the goal of the 2007 ICAND International Conference on Applied Nonlinear Dynamics was focused more sharply on the implementation of theoretical ideas into actual vices and systems

Perspectives of Nonlinear Dynamics: Volume 1 E. Atlee Jackson, 1989 The dynamics of physical chemical biological or fluid systems generally must be described by nonlinear models whose detailed mathematical solutions are not obtainable To understand some aspects of such dynamics various complementary methods and viewpoints are of crucial importance In this book the perspectives generated by analytical topological and computational methods and interplays between them are developed in a variety of contexts This book is a comprehensive introduction to this field suited to a broad readership and reflecting a wide range of applications Some of the concepts considered are topological equivalence embeddings dimensions and fractals Poincar maps and map dynamics empirical computational sciences vis vis mathematics Ulam s synergetics Turing s instability and dissipative structures chaos dynamic entropies Lorenz and Rossler models predator prey and replicator models FPU and KAM phenomena solitons and nonsolitons coupled maps and pattern dynamics cellular automata

Nonlinear Dynamics in Physiology Mark Shelhamer, 2007. This book provides a compilation of mathematical/computational tools that are used to analyze experimental data. The techniques presented are those that have been most widely and successfully applied to the analysis of physiological systems and address issues such as randomness, determinism, dimension, and nonlinearity. In addition to bringing together the most useful methods, sufficient mathematical background is provided to enable non-specialists to understand and apply the computational techniques. Thus, the material will be useful to life science investigators on several levels, from physiologists to bioengineers. Initial chapters present background material on dynamic systems, statistics, and linear system analysis. Each computational technique is demonstrated with examples drawn from physiology, and several chapters present case studies from oculomotor control, neuroscience, cardiology, psychology, and epidemiology. Throughout the text, historical notes give a sense of the development of the field and provide a perspective on how the techniques were developed and where they might lead. The overall approach is based largely on the analysis of trajectories in the state space, with emphasis on time delay reconstruction of state space trajectories. The goal of the book is to enable readers to apply these methods to their own research.
