## Multidimensional Continued Fractions:

Multidimensional Continued Fractions Fritz Schweiger, 2000 The book gives an up to date overview of various aspects of multidimensional continued fractions which are here defined through iteration of piecewise fractional linear maps This includes the algorithms of Jacobi Perron G ting Brun and Selmer but it also includes continued fractions on simplices which are related to interval exchange maps or the Parry Daniels map New classes of subtractive algorithms are also included and the metric properties of these algorithms can be therefore investigated by methods of ergodic theory The recent connection between multiplicative ergodic theory and Diophantine approximation presented as well as several results on convergence and Perron s approach to periodicity which has never appeared in book despite being published in 1907 Further chapters include the basic properties of continued fractions in the complex plane connections with Hausdorff dimension and the Kuzmin theory for multidimensional maps

Dimension Groups and C\*-algebras Associated to Multidimensional Continued Fractions Gregory R. Maloney, 2009 Thirty years ago Effros and Shen classified the simple dimension groups with rank two Every such group is parametrized by an

irrational number and can be constructed as an inductive limit using that number's continued fraction expansion. There is a natural generalization of continued fractions to higher dimensions and this invites the following question: What dimension groups correspond to multidimensional continued fractions? We describe this class of groups and show how some properties of a continued fraction are reflected in the structure of its dimension group. We also consider a related issue: an Effros-Shen group has been shown to arise in a natural way from the tail equivalence relation on a certain sequence space. We describe a more general class of sequence spaces to which this construction can be applied to obtain other dimension groups including dimension groups corresponding to multidimensional continued fractions.

Therese-Marie Basa Landry, 2015. **Multidimensional Continued Fractions** David Mark Hardcastle, 2000. **Continued Fractions** Doug Hensley, 2006-03-01. The Euclidean algorithm is one of the oldest in mathematics while the study of continued fractions as tools of approximation goes back at least to Euler and Legendre. While our understanding of continued fractions and related methods for simultaneous diophantine approximation has burgeoned over the course of the past decade and more, many of the results have not been brought together in book form. Continued fractions have been studied from the perspective of number theory, complex analysis, ergodic theory, dynamic processes, analysis of algorithms, and even theoretical physics which has further complicated the situation. This book places special emphasis on continued fraction Cantor sets and the Hausdorff dimension, algorithms and analysis of algorithms and multi-dimensional algorithms for simultaneous diophantine approximation. Extensive attractive computer-generated graphics are presented and the underlying algorithms are discussed and made available.

**Extensions of Trip Maps for Analyzing Periodicity of Multidimensional Continued Fractions** Rachel Ann Perrier, 2023 Ordinary continued fractions nest fractions with numerators equal to 1 and positive integer denominators via addition to represent real numbers It has been long established that such fractions will have a periodic expansion that is eventually have a repeating pattern in the denominators when the number being represented is a quadratic irrational In the 1800s Hermite expressed interest to Jacobi to find periodic expansions for cubic irrationals This led to the study of multidimensional continued fractions using matrices to encode algorithms for these analogs of continued fractions In this dissertation we explore an extension of the TRIP map algorithm developed by Dasaratha et al related to these multidimensional continued fractions which relates a location of an ordered pair in a triangle We consider the generalized version of this map called a 3 SIMP map which relates a location of an ordered triple in a tetrahedron This version further expands Hermite's question as 3 SIMP maps find periodicity results that relate to quartic roots instead of cubic roots Additionally we examine a connection between purely periodic multidimensional continued fractions produced by the Jacobi Perron algorithm to the combinatorial construction of Riordan arrays Riordan arrays provide a way to generalize Pascal's triangle and are studied for their combinatorial properties We describe a method to relate multidimensional continued fractions to families of Riordan arrays in the case where we have purely periodic multidimensional continued fractions of period 1      **Multidimensional Continued Fractions and the Topological Entropy of Pseudo-Anosov Maps** M.

Bauer, 1995      **An Introduction to Continued Fractions** Charles Godat Moore, 1964      Encyclopaedia of Mathematics Michiel Hazewinkel, 2013-12-01 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977 1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main

requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques
